Unbleached Quinine has been regarded with favor in pharmaceutical manufactures, because it has been usually quoted by our manufacturing chemists at from 30 to 40 cents per oz. cheaper than the Bleached, and there has existed among many physicians a prejudice in its favor as a more natural preparation, even if it did contain a small percentage of the other alkaloids of bark. It has been used in general by many of our best and most accomplished pharmacists under this supposition, and was used by us extensively until last fall, when our experiments in manufacturing Quinine from Bark and recovering Quinine from Gelatine-Coated Pills (which we had from time to time rejected on account of irregular shape or imperfect coating) taught us in reality that our previous methods of analysis and determination of this important salt were defective; further, that there were in market two quite distinct articles in proportion of constituents, the one being evidently an arrested manufacture, or Quinine as the result of probably a single crystallization in place of four, as usually required to separate completely the cinchonidia and quinidia, and bring the result up to the ether test; and another article, the result of concentration and crystallization of the so-called mother waters used in successive crystallizations, as before explained, which carry, with the salts of cinchonidia and quinidia in solution to be eliminated, a nearly equal amount of quinia, the result being, as far as our experience goes, from 35 to 45 per cent. of quinia sulphate in combination with cinchonidia sulphate mainly and a small portion of quinidia sulphate.

This latter article, which we have denominated Hospital Quinine to distinguish it from the first described Unbleached (although the terms have often been applied synonymously), we have reason to believe was sent us in the last shipments we received, notwithstanding the manufacturers' contract and our former erroneous method of analysis to the contrary.

The discovery of these facts, on our part, *for the first time* last autumn, led to consultation with several distinguished chemists and pharmacists, and the whole ground was carefully reviewed and examined, and the conclusion arrived at was that all ordinary tests in inexperienced hands for quantitative analysis of Quinine, when it was in natural combination with the other alkaloids of cinchona bark, could not be relied upon, and the only safety in general pharmaceutic manufacture consisted in the use of bleached or white Quinine.

This determination was announced by us last fall in the various journals, as was supposed in sufficient explanation, it having always been our custom to fully explain and inform the trade in regard to our methods of business, which are always open.

We regret only that we are not able to give more specific and positive additions to knowledge about this matter of Quinine and the other cinchona alkaloids, because it deserves and is receiving very much attention and investigation at the hands of Physicians and Chemists as one of the most valuable of all remedies, and that since our change from unbleached to bleached Quinine last November, evil disposed persons have taken occasion to misrepresent and misconstrue the facts for selfish purposes. There are fortunately a few facts that cannot be misconstrued. From our first connection with the inventor of the machinery for making Gelatine-Coated Pills, which commenced with the furnishing of materials for manufacture to the inventor in 1871 till November 24th, 1877, only unbleached Quinine was used, and it was as carefully examined as could be by various analysts until 1876, when our present analyst entered into our employ, highly recommended for general knowledge and experience, and deservedly so outside of Quinology, which is the most difficult of subjects, because of variety in raw material and in alkaloids that are so very similar as to be most difficult of entire separation. Since November 24th, 1877, we have *only used Bleached Sulphate of Quinine* in our Sulphate of Quinine Pills, as stated in our circulars.

We will remark that we believe, as the result of much experience, that a natural combination of the alkaloids of cinchona bark in good proportion is a better therapeutic for general use than any single alkaloid separated, and we attribute much of the favor attending our peculiar form of coating to the use of Unbleached Quinine as employed up to November last in the proportion of 111 ozs. (more or less according to our then supposed analysis) in place of 100 oz. of Bleached, as has been formerly carefully explained, but we defer this subject to the experience of the physician, being out of the province of the druggist.

It is the duty of the druggist and pharmacist to be well informed and not to misrepresent or conceal any fact in experience in manufacture or investigation, and we will be pleased to do this at all times, when called upon, as only thus can knowledge be advanced or confidence maintained; hence this article, which is respectfully submitted.

McKESSON & ROBBINS.

THE

Health Food Company,

74 Fourth Ave., adjoining Stewart's,

NEW YORK,

Would call the attention of the Profession to their

Cold Blast (Attrition) Whole Wheat Flour,

AS AN ADJUNCT IN THE TREATMENT OF

INDIGESTION, CONSTIPATION, and MAL-NUTRITION.

This Flour represents all the Food Elements of the Wheat, the indigestible silex coat being first taken off, and the entire kernel, including the phosphates, etc., being reduced to fine flour by a new process, in which both the admixture of detritus from mill-stones and the injurious effects of heating the flour during preparation, are entirely avoided.

IT IS CHEAPER THAN WHITE FLOUR,

Because it contains nearly four times the amount of the Mineral Substances, for

NOURISHING THE NERVES, BONES, HAIR, AND TEETH.

ATTENTION IS ALSO DIRECTED TO OUR

WHITE WHEAT GLUTEN,

For *diabetes*, and for those requiring the Nitrogenous and Mineral portions of the Wheat, *without starch*. This, like the Whole Wheat Flour, can be made into Bread and Crackers, or may be taken in various ways, and often proves a very valuable remedy for the *Constipation* and *Dyspepsia* associated with many diseases. In excessive fatness, and in disturbed mental states, the Gluten (crude and purified) proves very serviceable.

Circulars, descriptive of these and other Health Foods, mailed to all applicants.

SHEDDEN'S FOODS FOR THE DIABETIC AND DYSPEPTIC.

The prepared Flour of Bran, freed from Starch by Camplin's process, in 10 lb. cases, $5.00. Gluten Flour, rich in nitrogenous matter and the phosphates, in 10 lb. cases, at $3.00.

SHEDDEN & CO., Broadway, cor. 34th St., New York.

MELLIN'S FOOD

TRADE MARK.

For Infants and Invalids.

ENTIRELY SOLUBLE and NOT FARINACEOUS.

Price, $1.00 per Bottle. Trial Size, 60 cents. For Sale by Druggists.

We will furnish a sample of Mellin's Food free to any physician who may desire to try it in his practice. Send for a pamphlet containing Analysis Testimonials, etc.

See Lecture by Dr. J. LEWIS SMITH in *Medical Record*, May 25, 1878, p. 415.

PREPARED ONLY BY G. MELLIN, LONDON.

T. METCALF & CO., 39 Tremont St., Boston, Sole Agents for the United States.

WALTER BAKER & CO.'S CHOCOLATE AND COCOA

These Preparations have been the standard of purity and excellence for nearly one hundred years and have gained a world-wide reputation. They are pure, nutritious and healthy.

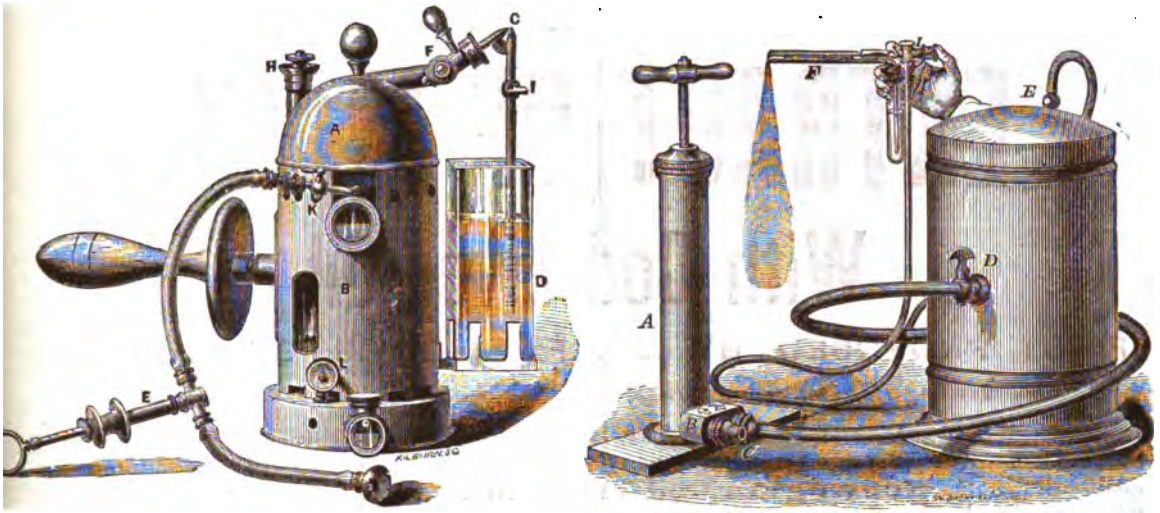
Cocoa contains as much flesh-forming matter as beef.

For Breakfast — For Luncheon — THE BEST — For Supper

Broma, an excellent food for Invalids, and unrivalled in delicacy and aroma. Breakfast Cocoa,—a general favorite. Baker's No. 1 Chocolate, the very best preparation of plain Chocolate in the market. Vanilla Chocolate, unsurpassed in flavor and quality.

Awarded the highest premium at the Paris, Vienna, and Philadelphia Expositions.

THE ANTISEPTIC ATOMIZER.



In this apparatus we have incorporated some of the best features of the Atomizing Apparatus heretofore made by us, already familiar to the profession. It is of best materials and workmanship—strong, durable, convenient, easily regulated, and by means of a new attachment of our own design, adequate without cessation of spray for any operation, or series of operations, however extended. Full description on application.

A NEW PAMPHLET

On Atomization of Liquids, with Formulæ of many articles of the Materia Medica successfully employed in the practice of a well-known American Practitioner, together with a description of the best forms of apparatus, will be sent post-paid on application. Also our new illustrated Catalogue of Surgical Instruments.

ATOMIZING APPARATUS BY COMPRESSED AIR.

This apparatus will be found entirely satisfactory on account of its elegance and perfect working qualities. It has a double acting Brass Pump (condensing or exhaust, at will), with valves unchangable by time or use. Strong Copper Receiver, Nickel Plated, 12 feet, light and flexible but strong; brown-colored Tubing and a self-closing cut-off (our own design, represented at I), readily connected with any tubes now in use.

PRICES REDUCED.

The Complete Atomizer	.....	**$5.00**	**Clarke's Atomizer**	.....	**$3.00**

The Boston Atomizer, $2.50.

See our pamphlet for description of a great variety of Atomizers, Tubes, etc.

CODMAN & SHURTLEFF,

MAKERS AND IMPORTERS OF SUPERIOR SURGICAL INSTRUMENTS,

13 & 15 Tremont Street, BOSTON.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt, and all its combinations.

EXTRACT OF MALT,

With Cod Liver Oil,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO

(See Transactions of American Medical Association, for 1876, page 176),

Is presented to the Medical Profession as an efficient, palatable, and very stable combination, consisting of equal parts of the **Extract of Canada Barley Malt** and the best quality of genuine **Norwegian Cod Liver Oil.** Many patients take this preparation who can not take the oil in any other form. It may be employed in all cases where Cod Liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

EXTRACT OF MALT,

With Cod Liver Oil and Phosphorus,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod Liver Oil, Phosphorus being added in the proportion of 1-100 grain to the dose, and so combined, as to be perfectly protected from oxidation. The **Trommer Extract of Malt Company** prepare this combination agreeably to the suggestion of **Dr. Wilson Fox.** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

EXTRACT OF MALT,

With Cod Liver Oil and Iodide Iron

Added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod Liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians referring to it in terms of high praise.

NEW REMEDIES.

☞ Your Special Attention is Called to the Note below.

QUININE FLOWER.—Used in the South during the late war, to some extent as a substitute for quinine, and now introduced to the profession by us.

YERBA REUMA.—From the Pacific slope, now introduced by us. Used in diseases of the mucous passages, especially in catarrh, acute and chronic, leucorrhœa, gonorrhœa, and dysentery.

KAVA KAVA.—From the Sandwich Islands. First introduced by us. An efficient and agreeable remedy in gonorrhœa, gleet, gout, and rheumatism.

CASCARA SAGRADO.—Introduced by us. It has long been regarded by the residents of the Pacific Coast as a sovereign remedy for habitual constipation and dyspepsia.

COTO BARK.—From Bolivia. First introduced by us. It is said to be almost a specific against diarrhœa in its various modifications.

COCA LEAVES.—A powerful nervous excitant, giving great vigor to the muscular system and sustaining the human frame under extreme physical exertion and fatigue.

PARAGUAY TEA.—Largely used in South Africa as a stimulant to sustain the system when undergoing hunger, or great fatigue during the summer heats.

GRINDELIA ROBUSTA.—From the Pacific Slope. Since this drug was first introduced by us, it has earned for itself a reputation for almost specific curative action in asthma.

GUACO LEAVES.—This valuable remedy was also first introduced by us. Its use is indicated in cholera, diarrhœa, chronic rheumatism, etc.

BERBERIS AQUIFOLIUM.—A new California drug, now introduced by us, possessing extraordinary powers as a combined alterative and tonic, and valuable in syphilitic and scrofulous diseases, salt rheum, etc.

BOLDO LEAVES.—First introduced by us. The new South American tonic. In France it has been employed in cases where quinine could not be tolerated.

ARECA NUTS.—First introduced by us. From India. Strongly astringent. Used by Dr. Morris, of England, in the removal of tape worm.

GRINDELIA SQUARROSA.—From California. First introduced by us. An excellent and efficient remedy in malarial diseases, enlarged spleen, etc.

YERBA SANTA.—From Northern California. First introduced by us. This drug is a standard remedy in Western States in bronchial and laryngeal disorders.

FUCUS VESICULOSUS.—First introduced by us. An anti-fat remedy of great merit. No derangement of the stomach or general system seems to result from its use.

NOTE.—There are several false varieties of this plant, which are offered as genuine. Physicians will readily perceive the difference in the taste of the fluid extract, as compared with our preparation of the TRUE plant.

KOOSO,
GUARANA,
BAEL FRUIT,

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For ***Headache***, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast.

and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties: it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*

Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Cars.*

Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.,** or to the Company's office, **205-213 E. 12th St., New York,** will receive prompt attention.

TAMAR INDIEN

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris.

To be had of all Respectable Chemists throughout the world.

MEDICATED DISCS

FOR HYPODERMIC INJECTION.

SPECIAL NOTICE.

Messrs. SAVORY & MOORE beg most respectfully to inform the MEDICAL PROFESSION generally that the great demand which has arisen for their **GELATINE PREPARATIONS,** since they were first introduced, has compelled them to extend their Laboratory in New Bond Street, by the erection of a Department for the exclusive purification and manipulation of these articles. The discs for **HYPODERMIC INJECTIONS,** and for **OPHTHALMIC PURPOSES,** as well as the **LAMELS FOR INTERNAL USE,** will henceforth be prepared under the **immediate supervision of the Firm.** This Special Department is so arranged that the delicate process of manufacturing the Sheets of Gelatine cannot possibly be interfered with, and consequently the **perfect purity** and **accurate dosage** of these important and delicate preparations may be **THOROUGHLY RELIED ON.**

The HYPODERMIC DISCS are now sold in boxes, which have been found to be of greater advantage for their preservation than the leather wallets originally employed.

SAVORY & MOORE, 143 NEW BOND STREET, LONDON, ENGLAND.

QUINETUM PILLS

(Sugar-Coated.)

The name **Quinetum** was given by Dr. De Vry to the collective alkaloids obtained from Peruvian bark; it has been extensively used by physicians throughout Holland in cases where the salts of quinine had been habitually employed. Dr. H. J. Vinkhuysen, Physician to the Household of the King of the Netherlands, has closely observed its effects, and arrived at the following conclusions:

1. The action of Quinetum in cases of marked or larval malaria, and especially in rheumatic affections due to malarious influences, is incomparably greater than that of quinine.

2. The tonic action of Quinetum is similar to, and even greater than that of quinine.

3. The influence of Quinetum in chronic cases is greater than that of quinine.

4. Persons who are liable to suffer from the toxic effects of quinine, and who therefore cannot take it without the greatest discomfort, can take Quinetum without this unpleasant effect, and yet obtain a similar therapeutical result.

5. Quinetum never causes noises in the ears.

6. Quinetum does not produce the unpleasant and even dangerous symptoms of quinine when given during the fit, and may be taken during the fit without causing any unpleasant feeling.

7. In all forms of pure malarial intermittent fever, Quinetum has the same apyretic effect as quinine, but is less powerful and acts more slowly. It must therefore be given in large doses, and at longer intervals before the ague fit, than quinine.

8. The only malarious disease in which Quinetum cannot be employed in place of quinine, is in pernicious fever. Quinetum requires more time to act than quinine, and as rapidity of action is absolutely necessary in this disease, Quinetum cannot be used in it as a substitute for quinine.

These Pills may be obtained of Druggists, or will be sent by mail, post-paid, on receipt of price.

BOERICKE & TAFEL'S

FRESH PLANT

Tinctures or Essences.

These are prepared exclusively from fresh plants gathered when in their full vigor, thus retaining all volatile constituents usually lost in drying, and utilizing all such juices, which are partly changed or rendered to a more or less degree insoluble by drying.

Medicinal plants growing in this country we gather ourselves, while of European plants we import the ready-made essences.

These plants are divided into three classes, and the treatment accommodated to their greater or less degree of succulence.

Tinctures according to **Class I** are made by adding one part of the expressed juice of the plant, one part of Alcohol.

Tinctures according to **Class II** are made from three parts of the plant to two parts of Alcohol by weight.

Tinctures according to **Class III** are made from one part of the plant to two parts of Alcohol by weight.

To distinguish these Tinctures from those of the U. S. Pharm., the Greek letter ϕ (phi) is written after their names on the label, and *appended to each bottle is a label giving the proportion of the plant in the tincture.*

These fresh plant tinctures are sold at the following rates, with few exceptions:

1 oz. 25 cts.; 2 oz. 45 cts.; 4 oz. 85 cts.; 8 oz. $1.60; 1 lb. $3.00.

A SYSTEM OF SURGERY,

THEORETICAL AND PRACTICAL,

IN TREATISES BY VARIOUS AUTHORS.

Edited by T. HOLMES, M.D.,

Surgeon and Lecturer on Surgery, St. George's Hospital, and Surgeon-in-Chief to the Metropolitan Police.

With numerous Woodcuts, Lithographs, and Chromo-Lithographs—in all four hundred and seventy-two illustrations—in five volumes octavo.

Price, in muslin binding, $45; or, in half turkey morocco, gilt top, $50.

WM. WOOD & CO., Publishers, 27 Great Jones St., New York.

LAZELL, MARSH & GARDINER'S
POWDERED
MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory; and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them. Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts*.

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	per oz

Printed Pills and Granules

These new pills and granules are the only real improvement made in pills for many years. While they are a novelty, their principal claim to superiority lies in the fact that they have undoubted advantages over all other pills, and are at **once the perfection of accuracy, and a safeguard against mistakes or substitution.** Their claim to the confidence of the medical profession and pharmacists rests on the entire purity of the ingredients used; perfect accuracy of composition and uniformity of size; ready solubility; tastelessness and harmlessness of the coating, which is vegetable; perfect preservation in all climates; entire security against mistakes or substitution, every pill or granule having printed upon its surface either its common name or its composition, as Pil. Cath. comp., or Pil. Quin, 1 grain.

We now offer the following assortment:

Granules, containing 1 milligramme, or 1-64th gr.: Arsenious Acid; Arseniate of Soda; Aconitine; Atropine; Digitaline; Bi-chloride of Mercury; Sulph. of Morphia; Phosphorus; Strychnia.

" containing 4 milligrammes, or 1-16th gr.: Sulph. of Morphia.

" containing 8 milligrammes, or 1-8th gr.: Sulph. of Morphia.

" containing 1 centigramme, or 1-6th gr.: Codeine; Calomel; Proto-iodide of Mercury; Podophyllin.

Pills, prepared according to the U. S. Ph. when officinal:

Aloes; Aloes and Assafœtida; Aloes and Mastich; Aloes and Myrrh; Assafœtida; Comp. Cathartic; Comp. Calomel; Comp. Colocynth; Iron, Carbonate; do. Citrate, 2 grains; do. Citrate of, and Quin., 2 grains; do. Pyrophosphate, 2 grains; Blue Pills, 3 grains; Calomel, 5 centigrammes, or 3-4th grain; Podophyllin, 1-6th, 3-4th and 1 grain; Proto-iodide of Mercury, with Opium, Ricord's formula; Quin. Sulph., 3-4th, 1, 1½, 2 and 3 grains; Rhubarb; Comp. Rhubarb; Santonine, 3-4th gr.; Triplex; Valer. Zinc., 3-4th gr.

These pills are sold in bottles of 100 and 500. Other pills will be added, and special formulæ made to order. Descriptive lists, giving assortment and prices, also samples, sent on application.

SOLE AGENTS FOR THE UNITED STATES.

CONCERNING
BELLADONNA PLASTER
A Few Words to Physicians and Surgeons.

BY A PHYSICIAN.

Until quite recently Manufacturing Chemists, in offering new combinations and improvements in Pharmacy to the Medical Profession, have found the Faculty very hospitable to the introduction of improvements adapted to their use.

But within a short time, conscientious Physicians have begun to discuss among themselves, very seriously, the propriety of welcoming the newer products of Pharmacy.

Why is this?

Because it is found that certain manufacturers, appealing to the convenience and profit of the apothecary, have been sacrificing merit and therapeutic value to elegance of appearance, and have employed officinal forms and professional nomenclature to foist upon the physician, by aid of the druggist, compounds of little or no value, and altogether unworthy of the high claims made for them.

Thus, the manufacture of medicinal agents for the use of Physicians is rapidly degenerating into empiricism, and is becoming almost as objectionable as the ordinary clap-trap of the "patent medicine" business.

Notably is this true with reference to that important and useful agent, *Belladonna Plaster*.

DR. J. M. GROSVENOR, graduate of Dartmouth, was the first to appreciate and turn to practical account, an improvement in compounding Belladonna Plaster by using purified rubber as a basis of combination.

His experiments in affectingthe combination in therapeutic and mechanical perfection were long continued, exhaustive and expensive.

But he finally succeeded perfectly, and his improved Belladonna Plaster was everywhere welcomed by the Faculty, as being the best form of this agent yet presented. It was universally adopted as the standard Belladonna Plaster.

Why?

Because it proved to be an entirely reliable preparation — presenting the drug uniformly, accurately, and with the most precise and skilful attention to convenience and activity.

The widespread popularity of Dr. Grosvenor's Improved Belladonna Plaster at once attracted the cupidity of empiricism, and the drug market was soon flooded with so-called "Belladonna" Plasters, branded "U.S.P.," and offered to Druggists upon one recommendation, *namely:* "It is 50 per cent. cheaper than Grosvenor's!"

A good many gudgeon like dealers promptly took the bait, and before long physicians began to express surprise and chagrin because Belladonna Plaster did not respond to their expectations in its effects as formerly.

Dr. Grosvenor found himself in receipt of numberless indignant communications upon the subject.

Belladonna Plaster is sold to the druggist in yard rolls, enclosed in a tin case. He cuts it into strips for dispensing as the physician may order.

The mechanical appearance and characteristic odor of Dr. Grosvenor's Improved Belladonna Plaster were closely simulated in the empirical articles; and if the druggist saw fit, for his own profit, to deceive the physician, the latter had no means of detecting the imposition except by noting the effect, and thus it happened that for a long time Dr. Grosvenor's legitimate and always reliable product had to bear the odium belonging justly to the empirics who had assailed him by simulating his article.

Finally he adopted, for the protection of the profession, the expedient of stamping his name at short intervals across the back of his "Belladonna Plaster" in violet ink, but omitting the words "Belladonna Plaster," for reasons which practitioners will understand.

Thus the fraud was checked, wherever the Faculty were informed of the precautionary measure; and the object of this article is to ask physicians everywhere to observe this test of genuineness, and in prescribing, to write for "*Emp. Belladonna Grosvenori.*

The true Belladonna Plaster in rubber combination will always bear this guarantee of genuineness—J. M. GROSVENOR, M.D., (acccompanied by a "trade-mark," consisting of a Belladonna Leaf, with the letters B and P upon it in monogram), printed in *fac simile*, at intervals of three inches across the back of the plaster in violet ink.

The profession are reminded that a true Belladonna Plaster, accurately prepared, *cannot* be a cheap product. Dr. Grosvenor originally sold his Plaster at the lowest practicable price, and that price has never been changed. Any plaster professing to contain the same elements that is sold at any price considerably lower, stamps itself at once as being the work of quackery.

Dr. Grosvenor has prepared a brief treatise upon Belladonna Plaster, which will be mailed (with sample of plaster) to any physician desiring it.

Physicains, if unable to obtain Dr. Grosvenor's improved Belladonna Plaster at their drug stores, will be supplied direct from the laboratory, by mail, upon receipt of one dollar. This concession is made to physicians only, and to those who cannot obtain the veritable article at home.

Address,

J. M. GROSVENOR, M.D., *22 Park Place,* **NEW YORK.** or **GROSVENOR & RICHARDS,** *97 Oliver Street,* **BOSTON.**

FOOD IS THE BEST TONIC!!

MENSMAN'S

PEPTONIZED

TRADE MARK.

BEEF TONIC.

The great necessity for a fluid food that would possess **all the elements necessary for the support of the system**, having been long felt by the medical profession, we call their attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drug or chemicals.

It is prepared after a thoroughly tested and scientific method.

LÖBEL SCHOTTLÄNDER, Carlsbad, Bohemia,

Recommend to the Profession and Trade especially

KISSINGEN WATER. (Rakoozy.)

The most important of all the Springs of Kissingen which comprises all the curative properties in the Rakoczy. It is especially used in all diseases of the abdomen, which are caused by debility of the stomach, originating from irritations and weakness and constipation of the peristaltic motion, causing Piles, Habitual Constipation, Loss of Appetite, Winds, Colics, etc.

It is also used in trouble of Gall Stones and Diseases of the Liver, and Jaundice, and especially as a specific in obesity. It ought to be taken in tumblers of ½ pint each, starting at first with two and gradually rising to four. This quantity is sufficient to produce one or two evacuations which, with a majority of diseases in which the Rakoczy is used, is sufficient.

EMSER SPRING WATER. (Kranchen.)

The Emser Mineral Water is used with good result in Catarrhal and other affections of the Mucous Lining of the Throat and Lungs. It is furthermore recommended by specialists in Europe for all female diseases, and particularly in cases of Hypertrophy and Swelling of the Uterus, and Sterility subsequent to this. The "Buben" Spring, especially, has an European reputation for these last diseases.

It is the one which is given to all patients who have a tendency towards miscarriage, or difficulties during menstruation.

According to our latest contracts with the proprietors of the different Springs, we get fresh shipments with every steamer, so as to be able to supply these waters in a quality not to be had formerly.

Sold, **ALWAYS FRESH,** only by us. For price and other information, please send for Pamphlet on Mineral Waters. Special Quotations on Quantities.

Continues to receive cases of Mental and Nervous Disease, at his residence in

PLEASANTVILLE, WESTCHESTER CO., N. Y.

Application for admission may be made to Dr. Choate, by mail, at Pleasantville, or personally, at his Office, 10 East 28th St., New York, on Mondays, Wednesdays, and Fridays, between 11 A.M. and 1 P.M.

PRIVATE INSTRUCTION IN
AURAL DISEASES,
At the NEW YORK EAR DISPENSARY, 400 W. 26th St., cor. 9th Ave.
By SAMUEL SEXTON, M.D.

Course, 20 Lessons. Class limited to Five. Fee, $20.00 each.
For further information, inquire at 12 West 35th Street.

SUNNYSIDE.
A PRIVATE MEDICAL HOME FOR NERVOUS INVALIDS.
Washington Heights, New York.

This Home, unsurpassed for its beauty of location and surroundings, and with handsomely furnished apartments, receives a limited number of cases of either sex, of *Mental* and *Nervous Diseases*, *Dipsomania* and *Opium Habit*, and offers to such patients all the attentions, comforts and attractiveness of a home, together with medical treatment. Applications may be made either by mail or personally at 152d St., bet. 10th Ave. and Boulevard.

Twelve trains daily from Hudson River Depot, 30th St. and 10th Avenue. DR. EDWARD C. MANN, M.D., late Medical Superintendent N. Y. State Emigrant Insane Asylum.

FOR SALE.

A Country Practice in a town 30 miles from Phila., 15 minutes' walk from depot; churches and schools. Practice paying $2,000 per annum and increasing. Married man preferred; will sell to either cheap, if applied for soon. Address, name in full, to
A. H. PIERSON, M.D., Trenton, N.J.

THE INEBRIATES' HOME, Fort Hamilton, L. I., N. Y.
(INCORPORATED 1866.)

President and Consulting Physician—THEODORE L. MASON, M.D., also President of the American Association for the Cure of Inebriates, and the Collegiate Department of the Long Island College Hospital. Attendant Physician—L. D. MASON.

The Buildings are constructed for this special purpose, and they are more complete, better furnished, and better adapted for the treatment of dipsomania than those of any other institution in existence.

The Management is systematic, thorough and adequate. There has been no change in the staff of medical or other active officers since the inauguration of the Home, nearly ten years ago.

The Classification is more perfect than, and the beneficial results are fully equal to, those of any other kindred institution.

Boarder Patients are classified according to accommodations required, and the charges are proportionately adjusted. Their departments are divided up into several floors, each containing such accommodations as the patients or their friends are willing to pay for. There are separate dining-rooms, lodging-rooms and parlors, billiard and bath-rooms. There is also a lecture-room for religious services, readings, concerts, etc. Several periodicals and daily papers are regularly taken. For the treatment of the better class of female patients an entire floor is set apart, handsomely furnished, having separate approaches, effectually isolating the sexes.

Remarkable Immunity from Death. The total death-rate since the opening has been one-half per cent., or one death for every two hundred patients. The total deaths of legitimate cases for treatment in the Home has been only one case in eight hundred during the same period. The rest were dying when admitted.

Patients are received either on their voluntary application, or by due process of law, and the powers of the charter to retain them within the limits of the grounds of the Institution are strictly enforced. For mode and terms of admission, apply to Rev. J. WILLETT, Secretary and Superintendent, at the Institution, Fort Hamilton [L. I.], N. Y.

SEABURY & JOHNSON,

Originators and Manufacturers of

U. S. PHARMACOPŒIA MEDICINAL AND SURGICAL

Plasters POROUS AND SPREAD in Rubber Combination

NEW YORK AND LONDON.

Received highest and only Award (Medal and Special Diploma of Merit) over all Foreign and Home Competitors in 1876.

THE JURORS' AWARD IS SUBSTANTIALLY.

ORIGINALITY.—The successful application of Rubber as a base for all medicinal and mechanical plasters.

RELIABILITY and general excellence of manufactures.

FACTS CONCERNING MEDICINAL PLASTERS IN RUBBER COMBINATION.

Indiarubber-spread and Porous Plasters possess indisputable advantages over all other Plasters: (1) The Rubber Combination preserves the incorporated drug or extract from decomposition or volatilisation; (2) They adhere closer and firmer; (3) They do not soil the skin or linen; (4) They are always pliable, and never become hard or brittle; (5) They adhere without heat or moisture; (6) An increased effect is obtained by being porous, as the Plaster neither slides nor moves from its affixed position.

BELLADONNA PLASTER, U. S. P.

IN RUBBER COMBINATION.

Messrs. SEABURY & JOHNSON claim that theirs is the most thoroughly reliable and only strictly officinal Belladonna Plaster ever offered the medical profession. It is an improvement on other Belladonna Plasters in several important particulars. First, it is incorporated with the officinal alcoholic extract only. Secondly, it is freed from all stimulating qualities, thereby insuring the uninfluenced sedative action of Belladonna. Thirdly, it adheres with greater tenacity than others. Physicians have been prejudiced in favor of Allen's English Extract; but recent analysis, fairly conducted by competent chemists, emphatically condemns the Inspissated Extract as a mild and unstable product, representing but one-half or less than one-half of the strength of the U. S. P. Alcoholic Extract of Belladonna. The following result, published in the *American Journal of Pharmacy*, in April, 1876, page 145 is furnished for your consideration, which indicates the following percentage of Atropia in the respective extracts:

Alcoholic Extract Belladonna, U. S. P.	*2,571*
Allen's English Extract	*1,411*
Herring's English Extract	*1,179*

The practitioner, as well as ourselves, has but one choice.

Considering these features from a professional standpoint, we offer a Belladona Plaster which cannot be improved upon.

SALICYLATED SURGEONS' RUBBER ADHESIVE PLASTER.

This article has met with unprecedented success, and has been emphatically pronounced by our most skilful General and Orthopædic Surgeons, as "the best Surgeons' Adhesive Plaster known". It is applied without heat or moisture, conforms quickly to the parts; is perfectly flexible and waterproof, and is ready for use at any moment. It is free from irritating properties and very healing. In counter-extension it has no equal, as it does not move or slide after being applied. Our India Rubber Adhesive Plaster is also spread on twilled linen, which resists the most powerful strain. In addition to these general improvements, the plaster being impervious to water, wounds can be cleansed without removing the plaster, obviating the necessity of constant redressing, saving labor and time. **Whenever continued powerful adhesion is required, it should be procured in porous form.**

MUSTARD PLASTER (spread on Cotton Cloth).

Our Mustard Plaster is a decided improvement over the best French makes; the mustard is manipulated so as to exclude all the moisture, retaining unimpaired by such treatment its essential properties. They are always reliable, conform quickly to the part, and when thoroughly wet do not break into pieces, as is the case with all other mustard plasters. They do not crack or peel off, and can be removed without soiling the skin or linen. Being **manufactured only of pure mustard,** they are perfectly free from Croton Oil or other dangerous substitutes, often employed to induce intense irritation.

RUBBER BLISTER PLASTER (Camphorated) B. P. STRENGTH.

This article has a splendid reputation; its characteristic action is not impaired by age in any climate. The whole fly is incorporated, which by constant manipulation is thoroughly and beautifully combined with the plaster. **Its properties are developed quicker, and its blisters in less time than the crude.** It never fails to blister when used as directed. In addition to its superior efficacy as a vesicant, we incorporate a sufficient quantity of Camphor, which, with the Olive Oil, used on the face of the plaster, **prevents Strangury.** This improvement will be appreciated by every practitioner. It is more reliable than any known cantharidal preparation.

CAPSICUM PLASTER.

Recently this article has crept into favor with our most esteemed physicians, and judging from results it is doubtless the best rubefacient known. It has the specific action of mustard without its objections. The characteristic action of Capsicum is uniformly maintained from twenty-four to forty-eight hours, without blistering, being mild, continuous, and stimulating. This plaster is spread in rubber combination and in porous form. Experience has taught practitioners that the Oleo Resin of Capsicum is too violent, frequently vesicating; we incorporate the crude drug in sufficient quantity, without risk to the patient. Our Capsicum Plasters will be found more practical for general use than the **so-called Mustard or Capsicum Papers.**

SAMPLES SENT TO PHYSICIANS ON APPLICATION.

SPECIAL NOTICE TO PHYSICIANS.

Quality is of great importance to the practitioner; by reliable preparations he supplements his own skill. You can therefore rest assured that every article we manufacture is of strict pharmacopœia strength, and incorporated with perfectly reliable Extracts and Drugs, well selected, carefully and conscientiously prepared, and manufactured invariably under the personal superintendence of one of our firm. **Our whole attention and study is devoted entirely to the art of Plaster making,** and we are ready at all times to receive suggestions from the fraternity, which may be of benefit to all.

MEMBER OF THE AMERICAN MEDICAL COLLEGE ASSOCIATION.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878-1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures upon special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and orde as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, JR., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consist chiefly of Recitations from Text-Books. This term continues from the first of March until the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the Faculty. Regular clinics are also given in the Hospital and in the College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

In corresponding with Advertisers please mention **The Medical Record.**

DETROIT MEDICAL COLLEGE.

SESSIONS OF 1878-79.

FACULTY.

PRELIMINARY AND REGULAR SESSIONS.

EDWARD W. JENKS, M.D., President,
Professor of Medical and Surgical Diseases of Women, and Obstetrics.

GEORGE P. ANDREWS, M.D.,
Professor of Principles and Practice of Medicine and Clinical Medicine.

ALBERT B. LYONS, M.D.,
Professor of Chemistry and Toxicology.

THEODORE A. McGRAW, M.D., Treasurer,
Professor of Principles and Practice of Surgery and Clinical Surgery.

C. B. GILBERT, M.D.,
Professor of Materia Medica, Therapeutics, and Clinical Diseases of Children.

N. W. WEBBER, M.D.,
Professor of General and Descriptive Anatomy and Clinical Surgery.

LEARTUS CONNOR, M.D., Secretary
Professor of Physiology and Lecturer on Diseases of the Eye and Ear.

RECITATION SESSION.

H. O. WALKER, M.D.,
Lecturer on Genito-Urinary System and Rectum.

DANIEL LA FERTE, M.D.,
Demonstrator of Anatomy and Lecturer on Orthopedic Surgery and Tumors.

J. G. JOHNSON, M.D.,
Lecturer on Diseases of Mind and Nervous System.

J. H. CARSTENS, M.D.,
Lecturer on Differential Diagnosis.

E. L. SHURLY, M.D.,
Lecturer on Diseases of Throat and Lungs.

F. A. SPALDING, M.D.,
Lecturer on Diseases of Skin.

C. C. YEMANS, M.D.,
Lecturer on Chemistry.

JAS. D. MUNSON, M.D.,
Demonstrator of Practical Physiology.

E. A. CHAPOTON, M.D.,
Demonstrator of Practical Microscopy.

The Collegiate Year is divided into three sessions.

PRELIMINARY SESSION opens Wednesday, September 4th, 1878, and continues one month. The Clinics are held and the Lectures delivered by the Professors of the regular Faculty, and in the same order and frequency as during the Winter Term. Opportunity is given to dissect or work in the Chemical and Physiological Laboratories.

THE REGULAR SESSION opens Wednesday, October 2d, 1878, and continues five months. During this term all the branches of *General Medicine* and *Surgery*, both scientific and practical, are taught with care and thoroughness. All students are daily examined on the subjects of the lectures and on their dissecting and laboratory work.

Senior students have *daily practice* in the *art of examining patients*, in forming their own diagnosis, prognosis and treatment. As this is done under the direction of the professor holding each clinic, and in the presence of the class, it constitutes an invaluable course of training.

THE RECITATION SESSION begins second Wednesday in March, 1879, and continues four months. Daily during this term there will be held a lecture, recitation and one or two clinics. The lectures will be upon special subjects of medical or surgical interest.

The recitations will embrace the general subjects of the Regular Session, viz., Anatomy, Surgery, Midwifery, Diseases of Women, Physiology, Practice of Medicine, Materia Medica and Chemistry.

Though the Recitation and Preliminary Sessions are optional, it is hoped that all who can, will avail themselves of their manifest advantages in supplementing the regular winter course.

Three Hospitals—Harper's, St. Mary's and St. Luke's—with two large free dispensaries, afford an abundance of clinical material for illustrative and practical teaching.

All lectures are delivered on Hospital grounds. The *peculiar feature* of this school is the *intimate union* between its *laboratory*, *clinical* and *didactic* instruction.

FEES

FOR PRELIMINARY AND REGULAR SESSIONS:

Matriculation	**$ 5 00**
Hospital Fees	**10 00**
Lecture Fees	**40 00**
Graduation	**25 00**
Lecture Fees to third course students	**25 00**

For the Recitation Term the Lecture Fees are $10, to those who attend the other courses. All others are required to matriculate and take out the Hospital tickets.

All fees payable in advance to the *Secretary*.

Board and Rooms can be obtained at low rates—according to accommodations—from $3 to $5 per week. Announcement and Catalogue, or any further information which may be desired, can be promptly obtained by addressing

LEARTUS CONNOR, M.D., Secretary,
92 CASS STREET, DETROIT.

Paris. 1867. Prize Medal.

1868. Silver Medal.

1872. Gold Medal.

Vienna. 1873. [Medal of Merit.

Phila., 1876. Medal of Merit.

BOUDAULT'S PEPSINE

In POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is sold in 1 ounce, 8 ounce, and 16 ounce bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France)

DRAGEES, ELIXIR, AND SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

Prepared by CLIN & CO., Pharmacists, Paris.

LA PLATA EXTRACT OF MEAT.

CH. DELACRE,
Sole Consignee,
IXELLES, BELGIUM.

Agents for the U. S.,
E. FOUGERA & CO.,
NEW YORK.

This Extract is a pure extract of Beef, prepared according to the improved process of Baron von Liebig, unsurpassed in quality, free from fat and gelatine, each pound of which contains the soluble nutritive constituents of 34 to 36 pounds of the finest beef, exclusive of bones and fat, corresponding to about 45 pounds of good butcher's meat. As a medicinal agent it will be found of great value to the sick, invalid, and persons and children of weak constitutions. ***It will keep unaltered for years in any climate.***

CAUTION.—Physicians wishing to use a pure extract of beef will do well to specify the ***"La Plata,"*** since it is never offered for sale until it has been analysed by Mr.

CH. DELACRE, Chemist, General Consignee at Brussels,

and found by him to possess the essential qualities of the best articles of this kind.

None genuine without the above trade-mark—*Bullock reclining.*

DOCTOR GIBERT'S

Depuratory Syrup and Dragees of Iodized Deuto-Iodide of Mercury

These preparations have been approved by the Academy of Medicine of Paris, and have been thoroughly tested in the hospitals of Paris in the treatment of *Syphilitic, Scrofulous* and other affections requiring the use of iodized remedies.

They are recommended for the utmost accuracy of composition, and their perfect preservation.

Prepared by VAUQUELIN-DESLAURIERS, Chemist, Paris.

E. FOUGERA & CO., Agents, New York.

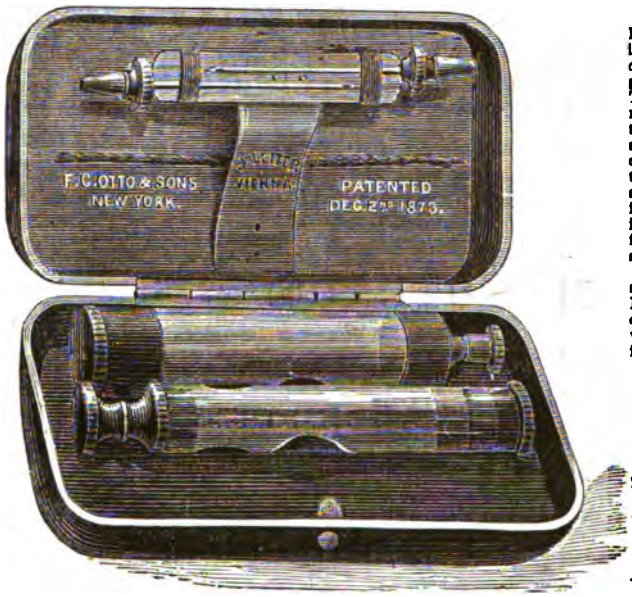
LEITER'S HYPODERMIC SYRINGE

MANUFACTURED AND PATENTED BY

F. G. OTTO & SONS,

Manufacturers and Importers of Surgical Instruments, Druggists' Sundries, &c.,

64 Chatham Street, New York.



The construction of this Syringe is as simple as it is novel. It consists of a glass cylinder, which is ground conic on the inside of each end; into these sockets fit two hard rubber cones *a* and *b*, Fig. 1. To facilitate the holding of the syringe the glass is ground in the manner shown at *C* and *D* in Fig. 1. The upper hard rubber fitting *a* is for the reception of the needle which is provided with a cone as shown at *D* in Fig. 2, the lower fitting *B*, Fig. 1, receives the piston-rod, which is also made of hard rubber. The glass cylinder being ground conic (making the opening larger at the extreme ends) makes the introduction of the piston very easy, after being taken apart for cleaning or lubricating. Having made considerable improvements in the manner of filling the syringe, as well as in the needles, we feel justified in saying that this syringe is far superior to any yet brought before the profession. The syringe is filled in a very simple manner.

Fig. 3 shows the vial. *B* in Fig. 3 is a cone which fits the socket in fitting *a*, Fig. 1, after having introduced cone *B*, Fig. 3, into fitting *A*, Fig. 1, unscrew the fitting *C* in Fig. 3, draw down the piston and the syringe will fill readily and without a chance for air coming into the same. *A* in Fig. 3 is a cap to close the vial.

To fill the vial unscrew the fitting *C*, Fig. 3, entirely.

The Advantages of this Syringe are:

1st—It has no metal to corrode, the only metal present being on the needle which, if wire is introduced after using, is easily kept open.

2d—The easy manner in which the Syringe may be taken apart for cleaning and lubricating.

3d—The manner of filling the Syringe.

The Syringe before described has been adopted by the ***Medical Department of the United States Army.***

DR. McINTOSH'S
NATURAL UTERINE SUPPORTER.

No instrument has ever been placed before the medical profession which has given such universal satisfaction. The combination is such that the Physician is able to meet every indication of Uterine Displacements. Falling Womb, Anteversion, Retroversion and Flexions are overcome by this instrument, where others fail: this is proven by the fact that since its introduction to the Profession it has come into more general use than all other instruments combined.

Among the many reasons which recommend this Supporter to the Physician is its self-adjusting qualities. The Physician after applying it need have no fear that he will be called in haste to remove or readjust it, as is often the case with rings and various pessaries held in position by pressure against the vaginal wall, as the patient can remove it at will and replace it without assistance.

The Abdominal Supporter is a broad morocco leather belt with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen. The Uterine Support is a cup and stem made of highly polished hard rubber, very light and durable, shaped to fit the neck of the womb, with openings for the secretions to pass out; as shown by the cuts. Cups are made with extended lips to correct flexions and versions of the womb.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, pass down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic adapt themselves to all the varying positions of the body and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Antiversion, Retroversion, or any Flexions of the womb, and is used by the leading physicians with never-failing success even in the most difficult cases.

Price—To Physicians, $8.00; to Patients, $12.00.

Instruments sent by mail, at our risk, on receipt of price, with 16 cents added for postage, or by Express, C.O.D.

What will the Weather be To-morrow?

POOL'S SIGNAL SERVICE BAROMETER,

Or Storm Glass and Thermometer Combined

WILL TELL YOU!

It will detect and indicate correctly any change in the weather 12 to 48 hours in advance. It will tell what kind of a storm is approaching, and from what quarter it comes—invaluable to navigators. Farmers can plan their work according to its predictions. It will save fifty times its cost in a single season. There is an accurate thermometer attached, which alone is worth the price of the combination. We will send it FREE to any address on receipt of **$2.00.** This great WEATHER INDICATOR is endorsed by the most eminent Physicians, Professors, and Scientific men of the day, to be the ***BEST IN THE WORLD.***

BEWARE OF IMITATIONS! None genuine without our **Trade-Mark.** Every instrument warranted PERFECT AND RELIABLE. NAPHEYS'

MEDICAL THERAPEUTICS.

1 Vol., Large 8vo. 598 Pages.

SURGICAL THERAPEUTICS.

1 Vol., Large 8vo. 588 Pages.

Fifth Edition (1878), Enlarged and Revised to Date.

(For PRESS NOTICES, see "MEDICAL RECORD," April 13th.)

These two works have unequalled value for the practising physician. They give him a brief and clear synopsis of the practice of the most eminent living physicians and surgeons.

The **MEDICAL THERAPEUTICS** contains therapeutical directions from over 700 authors, and gives 1,346 formulæ drawn from the most eminent practitioners. But it is by no means a mere formulary. On the contrary, it aims to be a systematic analysis of all current and approved means of combating disease, including electricity, baths, massage, mineral waters, external remedies of all kinds, etc., etc.

Especial attention has been paid to noticing all the more important *New Remedies* and their applications, and the editor has introduced, as a special feature in this edition, the employment of the *botanical* remedies from the indigenous materia medica of the United States.

The **SURGICAL THERAPEUTICS** is an entirely new and unique work, treating of the medical aspects of surgery.

The following are a few of the numerous subjects treated of in this volume:—

The Preventive Treatment of Inflammation. The Constitutional and Local Treatment of the Sthenic, Asthenic and Irritative Types of Inflammation. General and Local Anæsthetics. Anæsthesia of the Larynx. The Open Treatment of Wounds. Guerin's Raw Cotton Dressings. Hewson's Earth Dressings. Gamgee's Dry Dressings. Dolbeau's Alcohol Dressings. Lister's Antiseptic Dressings. Spence's Boracic Acid Dressings. Polli on the Sulphites as Antiseptic Dressings. Dr. Garretson's Specific Treatment of Erysipelas. Directions for Richardson's Styptic Colloid, Styptic Collodion, Cotton, Lint and Wool, Pancoast's Styptic, etc. Methods of Torsion and Pressure in Hemorrhage. Treatment of Shock, by Drs. Brunton, Hood, Gross, Fothergill, Fuller, Holmes, Hutchinson, etc. The Use of Physostigma, Aconite, Atropia, Strychnia, etc., in Tetanus. Weir Mitchell on Traumatic Paralysis and Neuralgia. The Latest Views of the German Surgeons, Esmarch, Stromeyer and Billroth on Gunshot Wounds. The Best Remedies in Hydrophobia. Halford's Ammonia Treatment of Snake-bites. Numerous Applications for Burns, Scalds, Frost-bites, Bedsores, Carbuncles and Boils. Syme's Treatment of Indolent Ulcers. Villate's Solution for Caries. Morton's Improved Treatment of Spina Bifida. Massage in Paralysis, Sprains, etc. Squire's Method with Nævus. Miner, Vallette, Colles and others, on Varicose Veins. Various authors on Caries of the Teeth, Pharyngitis and Tonsillitis. Ruppaner's London Paste for Enlarged Tonsils. Heaton's New Method for the Radical Cure of Hernia by Subcutaneous Injections. The Carbolic Acid Treatment of Hemorrhoids. Impotence, Masturbation and Spermatorrhœa occupy 30 pages, a monograph in itself.

The chapter on Lesions of the Organs of Special Sense includes the Nose, Eye, and Ear, as Ozæna, Epistaxis, Rhinitis, Conjunctival Diseases, Iritis, Styes, Wounds of the Eye, Otorrhœa, Tinnitus, etc. Under new growths are given Mackenzie and others on Goitre, and the medical and local treatment of Fatty Tumors, Polypi, Warts, Corns, etc.; and twenty-four pages are devoted to Cancer, giving Williams' Bromine Treatment, the Arsenical cure of Marsden and Esmarch, Maisonneuve's Caustic Arrows, Michel's Sulphuric Acid Paste, etc., and the famous "Cancer Salves" of Landolfi, Fell, Payne, Bright, etc. A chapter is given to the treatment of Scrofula as recommended by Gross Toland, Savory, J. L. Smith, Porcher, etc., including Scrofulous Ophthalmia, Ulcers, Glandular Enlargements, etc. The volume closes with chapters on the Therapeutics of Skin Diseases, Gonorrhœa and Syphilis, in the last of which Keyes' tonic treatment is described.

Especial pains have been taken to give carefully the uses and indications of recently introduced remedies, such as Chrysophanic Acid, Terebene, the Salicylates, Hamamelis, Dioscorein, Daturia, Eserin, Grindelia, Hydrobromic Acid, etc. The number of formulæ given is 987, drawn from the practice of the most eminent living surgeons. The Therapeutical directions are clear and minute, and the volume will be found unique of its kind, and invaluable in practice.

The two books are sold separately, at ***$4.00*** *in cloth, or* ***$5.00*** *in full leather, each, sent by mail, post-paid. Full Tables of Contents sent on application.* (Quote MEDICAL RECORD.)

OF THE

NEW YORK DISPENSARY.

The New York Dispensary Virus is as well-known if not better than any other Vaccine Virus in the United States, and it still continues to keep up its reputation.

Dr. N. A. Robbins succeeds Dr. Foster as Vaccine Director. Dr. Robbins is well known as a Vaccine Producer, and will maintain the standard of the Virus to its highest point. Liberal terms made with Druggists, Health Boards, and Public Institutions, etc.

Quill Slips (¼ quill charged at square cut end convex surface).....**$0.25.**
Capillary Tubes,..... .... **1.00.**

We would recommend Quill Slips as preferable, and in all cases of primary vaccination will fully guarantee.

Fresh supplies of Vaccine, every three days, can be obtained of New York Dispensary, Centre and White Streets; at Laboratory, 94 Pineapple Street, Brooklyn; New York Hospital, West 15th Street, and of all the leading Druggists in the City.

NEW YORK DISPENSARY, Cor. Centre and White Sts., New York.

Drs. ROBBINS & LEWIS, 94 Pineapple Street, Brooklyn. *Quote* MEDICAL RECORD

BOVINE VIRUS (RHODES').

This Animal Vaccine Virus, now used exclusively in the NORTH EASTERN DISPENSARY, is obtained in its purest form, under the immediate direction of Dr. WARREN SCHOONOVER, and is endorsed by many of our leading Physicians, such as Willard Parker, M.D., Professor of Clinical Surgery College of Physicians and Surgeons, New York City, and many others, and is offered to the profession the following rates:

One Quill Slip (charged in convex surface at square cut end), *20 cents*
Seven " " " " " *$1.00.*
Crusts, (Humanized, first removal from heifer.) each, . . *2.00.*

Each Quill is completely excluded from the action of the atmospheric air by a closely-fitting hermetically-sealed gutta percha covering, impervious to water or other destroying influence, and is guaranteed in all cases of primary vaccinations—if used in accordance with printed directions accompanying the same within eight days of their receipt. Should any fail, a second supply will be furnished gratis. All orders and letters of inquiry may be addressed to

W. SCHOONOVER, M.D., House Physician North Eastern Dispensary, 222 East 59th St., N. Y.

All orders by mail or telegraph, requiring dispatch, will be forwarded without delay, postage free. Remittance should accompany the order. A liberal discount, when used in large quantities, to Public Institutions, Health Boards, etc.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

K. & M.

Improved Extract of Malt.

Made from Canada Barley, selected, malted, dried, and extracted by, and under the immediate supervision of, Graduates of the Philadelphia College of Pharmacy. CONCENTRATED IN VACUO. This is as perfect an extract of the highest grade of carefully selected Barley Malt as can be PREPARED BY THE USE OF THE MOST IMPROVED VACUUM APPARATUS, recently designed for our own laboratory. As A FOOD in Syphilis, Typhoid and other fevers, Consumption and similar wasting diseases, it is without an equal for the rapid building up of a degenerate or depraved condition of the blood or tissues, since it acts not only as food itself, but its use converts and changes other kinds of food into a condition allowing easy assimilation.

We append the following letter from a gentleman well known to all:

MESSRS. KEASBEY & MATTISON: PHILADELPHIA, *September* 25, 1877.

Gentlemen.—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, *Secretary American Medical Association.*

K. & M.

Extract of Malt with Cod Liver Oil.

ORIGINATED BY KEASBEY & MATTISON.

THE MOST NUTRITIVE EMULSION EVER MADE.

Our Improved Extract of Malt, with 50 per cent. of our fine Norwegian Oil, is pre-eminently the emulsion of Cod Liver Oil, since it has double the nutritive effect of any other emulsion of oil. It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but, by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that it unites perfectly with water in any proportion, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Improved Extract of Malt with Pepsin.

This is our Improved Extract of Malt, with the addition of five grains of our Saccharated Pepsin to the tablespoonful. For dyspeptic disorders it is found of great value, since it digests both albuminoid and amylaceous matter, thus furnishing a preparation that is needed in the majority of cases of dyspepsia and other derangements of the stomach dependent upon the non-assimilation of the food.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Beef, Iron, and Wine, with Extract of Malt.

ORIGINATED BY KEASBEY & MATTISON.

A NOURISHING DIET FOR INVALIDS AND CONVALESCENTS.

As a simple restorative food, where a tonic effect is desired, there is perhaps nothing in the whole line of tonic dietetics of so much real value as this preparation. It furnishes the diseased stomach with the power of assimilating amylaceous diet, and supplies readily assimilable food at the same time, in the articles of Malt Extract. The iron salt supplies the red corpuscles that are deficient in the blood, while to the nutrient effect of beef is added the stimulant effect of a fine sherry wine. Each tablespoonful represents two grains of the soluble citrate of iron, and one ounce of finely-chopped raw lean beef, with equal quantities of our Improved Extract of Malt and sherry wine.

For sale by Druggists everywhere. Samples may be obtained of

THE MANUFACTURERS,

KEASBEY & MATTISON,

SCOTT'S EMULSION

PURE COD LIVER OIL

WITH

HYPOPHOSPHITES OF LIME AND SODA

PERFECT, PERMANENT, PALATABLE.

FORMULA.—50 per cent. Pure Cod-Liver Oil, 6 grains of Hypophosphite of Lime, 3 grains of Hypophosphite of Soda to a fluid ounce.

We respectfully recommend this preparation to the medical profession, knowing they will find it of the greatest value in the wasting diseases indicated by a defective nutrition. The oil is so incorporated that the nauseous taste and smell is entirely removed, enabling the most delicate stomach to bear it. But its especial advantage over all other combinations is the perfection and permanency of the Emulsion. We will be pleased to send a sample by express, prepaid, to any physician in the country, if he cannot obtain it at his druggist's.

SCOTT & BOWNE, Manufacturing Chemists, 125 Hudson St., New York.

NEW YORK, *Sept. 4th*, 1878.

Messrs. SCOTT & BOWNE.—*Gents:* I have prescribed Scott's Emulsion of Cod-Liver Oil with Hypophosphites, in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather; and is more palatable than any other preparation of oil that I have used. Yours very respectfully,

ROBERT WATTS, M.D., *President Medical Board Charity Hospital.*

Original Lectures.

ON GONORRHŒA.

A CLINICAL LECTURE DELIVERED AT THE COLLEGE OF PHYSICIANS AND SURGEONS, CITY OF NEW YORK.

By F. N. OTIS, M.D.,

CLINICAL PROFESSOR OF GENITO-URINARY DISEASES.

(Reported for THE MEDICAL RECORD.)

LECTURE II.

GENTLEMEN:—I propose to continue to-day the study of the subject which engaged our attention at the last lecture.

You may infer that gonorrhœa is a subject of some importance when I tell you that within the year 1877, a prominent English surgeon has issued a book confined to this subject alone, and containing about 400 pages. It is the only book, devoted solely to the consideration of gonorrhœa, of which I have any knowledge. Its author is a gentleman who has been identified with the study and treatment of genito-urinary diseases in England for many years, and I can commend this book to you as the most valuable and comprehensive work on this subject in our language. But in it Mr. Milton has raised some issues which I thought were settled; especially that most important one with reference to the *specific character* of gonorrhœa. After considering the question, as it would seem quite thoroughly, the author arrives at a conclusion which, to me at least, is extraordinary, which is that, so far as he is able to judge, *gonorrhœa is the result of gonorrhœa only*. Now, the French authorities, of which Ricord is the leading representative, almost without exception make the definite and unequivocal statement that true gonorrhœa may be acquired from a simple leucorrhœa. Ricord gives repeated instances of this kind, and also cites examples in which a gonorrhœa, not distinguishable from that acquired by contagion, has been produced solely by a persistent and continued ungratified venereal excitement.

In this country we have Dr. Bumstead (favorably known as an authority in this department) and also Drs. Van Buren and Keyes (who have written an excellent work upon genito-urinary diseases), expressing themselves with the greatest positiveness on this point, each giving cases when, to their certain knowledge, disease in no practical way differing from genorrhœa, has been acquired by contact with discharges which were not gonorrhœal.

Dr. Fordyce Barker, of this city, quoted by Dr. Bumstead, speaks of a peculiar form of metritis which has associated with it a leucorrhœal discharge, that in repeated instances has produced a purulent urethritis in the male. Not long since a gentleman came into my office, with the statement that he had been married nearly one year; that shortly after marriage a purulent discharge came from his urethra. On consultation with his physician he was told it was of slight importance, and had probably been acquired from a leucorrhœal trouble from which his wife was then suffering. From that time, within three or four days after each sexual congress with his wife, a purulent discharge appeared in his urethra and continued until assisted by an astringent injection. When examined, the man was found to be free from any trouble whatever. Upon examining the wife it was ascertained that she was suffering from retroversion of the uterus; that the surface of the external os was eroded and covered with a thin layer of muco-purulent material. The uterus was restored to its normal position and retained by a pessary. I was of the opinion at the time that the erosion and discharge were due to displacement of the uterus, and so stated. Under suitable treatment the lady made a prompt recovery, and from that time the gentleman suffered no more from his urethral trouble.

To me, the case seemed to be one that pointed clearly to the leucorrhœal discharge, dependent upon the condition of the uterus, as the cause of the urethral discharge in the husband. This, and the case which I related at the last lecture, in which the patient produced a urethritis by the violent introduction of a sound, I would put forward as among those where there is every reason to believe the urethritis to have been produced by other causes than contact with a gonorrhœal discharge.

Mr. Milton admits that "urethral discharges do appear in men as the result of connection with women laboring under leucorrhœa, *in whom there is no reason to suspect a present or a previous blenorrhagia.*" This admission, however, is wholly negatived by the sentence which follows it, thus: "It must, I think, be equally admitted that the facts supposed to establish this, are, when we come to sift the matter closely, generally vague and few." The property of contagion with Mr. Milton, points directly to specific cause; to already existing gonorrhœa as the origin of it in all cases, and where there is absolutely no evidence of such origin, and no reason to suspect it, belief to the contrary, Mr. Milton says, "must remain a mere conviction, and cannot be raised to the stability of truth."

Mr. M. states that in no case that he has read of "is there anything to show that the surgeon had satisfied himself as to the *previous state of the organs in both persons.*" On the strength of this he would seem to claim that all the evidence in favor of the non-specific character of gonorrhœa, the carefully observed and reported cases of accepted authorities, are without value, notwithstanding the positive belief acquired through the long and studious experience of such men as Ricord, Didery, Bumstead, Van Buren, and, unequivocally stated, we must believe all urethral discharges associated with the contagious element to have a gonorrhœal origin, "even when there is no evidence of such origin, and no reason to suspect it." Personal statements, from no matter whom, circumstantial evidence, character of individuals, repeated coincidences, all go for nothing.

Even the case previously cited, when the disease was believed *proven* to be of traumatic origin, and which was believed proven to be contagious (and hence gonorrhœal) by the supposed *proven* communication to a presumably healthy wife, even this case may be waived out of the contest as among the not *absolutely* proven cases.

We, however, must admit that all clinical observations and investigations are of necessity more or less empirical until carried to a point coincident with, or to the establishment of some fixed physiological or pathological law. Until such law is established, the most important, the most conscientious and extensive clinical labors must be open to the denial and depreciation of every passing observer of little or much experience. Thus it happens that the most important question, upon the correct or faulty solution of which the honor and happiness of individuals—even of whole families—may depend, the accumulated experience and the deliberate conclusions of our wisest men are disregarded, and the specific nature of gonorrhœa asserted upon the basis of a purely negative personal

experience. If anything could give an incentive and impetus to a movement towards a more scientific solution of the matter we certainly have it here. Naturally we look to the great authorities in histological and pathological science for some clue which shall lead to a more definite understanding of the true nature of the contagious element of gonorrhœa, as well as that equally contagious property which is characteristic of conjunctivitis and infantile leucorrhœa.

It has occurred to me that the difficulty of settling the question with reference to the specific character of gonorrhœa may be simplified if we can go behind all clinical records and consider the changes which occur in the transition between the normal formation of epithelial elements and the characteristic pathological products. Rindfleisch—and his opinion is entitled to consideration—in speaking upon the question of the formation of epithelium, uses a significant phrase, namely, "epithelial infection," and says: "The opinion is inevitable that the embryonal formative cell can only become an epithelial cell when it comes in contact with such; *we must believe in a kind of epithelial infection.*" That is to say, when a formative embryonal cell comes up from the cellular tissue to take the place of a cell that has preceded it, its form and character is determined by coming in contact with epithelial cells already formed.

With reference to other tissues, it is claimed that the peculiar form which the germinal or formative cell is to take is determined by contact with the tissue of which it is destined to become a portion.

If this view is accepted—and I see no ground for objection, but, on the contrary, it is a beautiful explanation of the manner in which different tissues are formed—we have infection as a physiological process, and now the interesting question arises, At what point does the epithelial element cease to have that infective influence? In other words, At what point does it cease to have the contagious property? For, it is here distinctly shown that the epithelial elements possess an essential and characteristic property of contagion. If this be the case shall we accept the contagious element as evidence of gonorrhœa, when we find it in the physiological process? It appears from that, as soon as the fact is recognized, that a contagious principle is contained in the physiological constitution of the parts. The doctrine of contagion receives a fatal blow. One thing is very certain, viz., that as long as this physiological infection, this influence of epithelial cells by their contact with each other, is continued in a salutary way, it gives rise to no disturbance whatever, and the thought of contagion does not arise. But when a cell which has fallen from its integrity exerts its vicious influence upon other cells, disturbance is manifest, and compels attention to its character and powers.

Because gonorrhœal disease is contagious, it has been claimed that this property must be regarded as evidence of the presence of a special virus. If, however, it is the contagious property alone that is characteristic, and this property is the proven attribute of all cells of gonorrhœal discharges, it can no longer be regarded as evidence of the specific character of gonorrhœa; hence the only distinction to be recognized between gonorrhœa and urethritis is a moral one. The term gonorrhœa implies gross immorality. A good man, then, with simple urethritis, perhaps occurring independent of sexual contact, may, by injudicious living or venereal excess, elevate his simple urethritis up to a contagious point. Then he has *gonorrhœa*. He has done nothing morally wrong; he has simply been placed without the pale because of his urethral discharge assuming a contagious form. In that condition he has, perhaps, communicated the disease to his wife, who would, under Mr. Milton's teachings, be qualified to sue for a divorce, and to obtain it, notwithstanding there was no evidence of gonorrhœal origin, nor any reason to suspect it.

DIFFERENTIAL DIAGNOSES.

Having endeavored to ascertain what gonorrhœa is, we will briefly allude to the question of differential diagnoses.

Inflammation of the mucous membrane covering the glans penis and reflected upon the prepuce or balanitis, may be mistaken for gonorrhœa. This condition may arise from various causes, such as irritation produced by accumulation of sebaceous material beneath the prepuce, or from hypertrophy of the papillæ of the mucous membrane covering of the glans, as in the case exhibited this afternoon.

In that case the irritation produced by the enlarged papillæ had given rise to pus, which had accumulated beneath a long prepuce in such quantity that when the prepuce was drawn back a discharge from the preputial opening took place that could very readily have been mistaken for one issuing from the urethra.

I have encountered cases in which such a mistake has been made, and injections containing various materials used for months in the supposition that the patient was suffering from gonorrhœa, when in truth the urethra was free from all disease except that produced by the injections. In some of these cases it is difficult, because of the degree of phimosis present, to ascertain whether the discharge issues from the urethra or not: but your treatment should not be commenced until that question has been settled.

The next point is to ascertain whether the disease you are called upon to treat is a simple urethritis or a gonorrhœa acquired by contagion.

In most cases the character of the exposure is not well understood either by the person exposed or by the physician. The presumption, when a discharge appears in the urethra of the male after illicit intercourse, is in favor of a gonorrhœa existing in the woman with whom such intercourse is held. At the same time it is not certain that a person having had sexual connection, and having had urethral trouble four or five days afterwards, that a gonorrhœa has been acquired. The natural conclusion is that a gonorrhœa has been contracted.

Now in a very large number of instances it would be a mistake, and a very grave mistake, to consider such a discharge a gonorrhœa, because such a condition may arise from contact with simple leucorrhœa, and also from contact with the menstrual discharge. It is a necessity in these cases to wait, to treat the patient in a very simple way for a few days, until it is ascertained whether or not it is an active contagious disease. If it is not, simple means will be sufficient to effect a cure, and the disease will gradually fade away, leaving the parts in a healthy condition.

Quite commonly, not so much now as formerly, however, an attempt is made to cut the disease short by the use of some active injection. This plan is fast going into disrepute, and justly so, for by adopting it the advantage is at once lost of being able to determine whether the disease would not have readily passed away within a few days by the use of simple means. By such treatment you necessarily add an inflammatory trouble, and if the case is one of real gonorrhœa, you will increase the activity and the inflammatory character of the disease.

Original Communications.

THE TREATMENT OF SOME FORMS OF DYSPEPSIA (CHRONIC CATARRH OF THE STOMACH).

By Wm. B. NEFTEL, M.D.,

NEW YORK.

During the last ten years I have had the opportunity of observing a considerable number of patients affected with chronic catarrh of the stomach of long standing. They were referred to me principally on account of the accompanying intense gastralgic pains and the very unpleasant cerebral symptoms. In a number of cases these latter symptoms assumed so predominant a character in the history of the disease, that some doubt was entertained as to their true significance—whether it was not the brain symptoms which constituted the primary affection, and the dyspepsia a secondary symptom, instead of vice versa. I could, however, almost always convince myself that the chronic gastric catarrh was the primary affection that brought on the secondary cerebral symptoms, because it existed long (sometimes years) before the appearance of the cerebral symptoms, which latter commenced in a mild, scarcely noticeable form, and only gradually became more serious, and generally disappeared with the cure of the catarrh.

In the majority of cases that have come under my observation, the disease was in an advanced stage, and the patients presented a high degree of anæmia and emaciation. They complained of general prostration and of inability to work intellectually, of loss of memory, sometimes of dimness of vision, without any objective cause, occasionally of tinnitus aurium and frequent faintness; more especially of vertigo, that rendered them timid in walking alone. They almost always felt chilly, and complained of a sensation of fulness and a constant uneasy feeling in the epigastrium. This uneasiness increased to intense pain several times in the twenty-four hours, generally after meals, and especially during the night, thus interfering with sleep, which was sometimes interrupted by the pain at regular hours. They have had frequent eructations, nausea, and sometimes vomiting, and complained of complete want of appetite, notwithstanding their extreme weakness and anæmia. The bowels were costive, the pulse small, the heart's action feeble, the respiration slow, the temperature not increased; rather subnormal, the skin pale and dry, the abdomen tender and distended in the epigastrium.

On examination of the contents of the stomach (ejected by vomiting, or removed with the stomach-pump), I found the reaction sometimes neutral, sometimes even slightly alkaline; and when the reaction was acid, it was not owing so much to the presence of free hydrochloric acid as to that of lactic, butyric, acetic, and other volatile fatty acids. Under the microscope I almost always found numerous sarcinæ ventriculi and other microscopic fungi; the gas escaping with the eructations was a mixture of hydrogen, carbonic acid, and air.

The gases, the acids, the fungi, etc., leave no doubt that the stomach of these patients is the seat of a morbid fermentation. The food, instead of undergoing the normal digestion under the influence of the gastric juice (which in the normal condition contains free hydrochloric acid), is undergoing fermentation, with evolution of gases and development of fatty acids, of which especially the butyric acid acts upon the stomach as an acute irritant. Hence the distention of the stomach, the gastralgic pains that increase during the height of the fermentation (some time after the introduction of food), and all the other local and general consequences which always accompany chronic gastric catarrh. The permanent dilatation of the stomach (gastrectasia) owes its origin to the paretic condition of its muscular coat, and this causes stagnation of the food within the stomach, the relaxed walls of which are not able to forward the contents by their impaired contractions. On the other hand, this stagnation of the food promotes and perpetuates the fermentation, the vomiting, the constipation, etc. The general consequences produced by the gastric catarrh are chiefly due to the impaired nutrition of the whole system, and manifest themselves as general emaciation and anæmia, especially that of the brain.

Generally the patients who came under my care had tried before a great variety of therapeutic methods. As a rule, it was first attempted to control the gastralgic pains with alcoholic stimulants, spirits of camphor, etc., and which in the earliest stages of the disease would relieve them temporarily, but after a while lost entirely the power of producing the desired effect. Anodynes were then resorted to, with a similar result. Of medicinal remedies, pepsine, bitters, nux vomica, strychnia, bismuth, alkalies, purgatives, etc., had their turn without avail, and of external applications, different plasters, hydropathy, rubbing, electricity in the form of electrical baths, general faradization, or central galvanization. In addition to all this, special kinds of movement and lift cures, and also different mineral waters and milk diet were vainly tried.

Notwithstanding all these remedies and methods, the disease continued to make steady progress, the dilatation of the stomach increasing sometimes to an enormous extent, the gastralgic pains becoming incessant, with frequent exacerbations, depriving the patient of sleep, and the emaciation, anæmia, and general prostration reaching the highest degree. But, long before the disease advanced to that stage, the patients generally came to the conclusion that they must avoid some articles of food which in their experience increased the eructations, pain, nausea, and vomiting, and therefore at first gave up eating those vegetables which produce flatulence, then a great many other articles, gradually reducing the variety of their diet, and living exclusively on Graham bread, oat meal, mutton chops and beefsteak. Water was also avoided as much as possible, on the supposition that it dilutes the gastric juice, and hence increases the indigestion. At last even this simple diet augmented their suffering and had to be changed for a diet amounting to slow starvation, viz.: rice-water, sometimes rice boiled with milk, and the juice of meat. The only temporary relief during the attacks they found in hot water taken in large quantities. These patients, therefore, had to resort to hot water and the starvation diet to make their life at all bearable. In this stage of the disease the condition of the patients seemed so alarming that doubts would arise as to the correctness of the diagnosis. Indeed, the cachectic appearance of the sufferers would warrant the suspicion that a cancerous affection of some abdominal organ, or cirrhosis of the liver existed, though neither a tumor nor any characteristic symptom of cirrhosis could be detected by the physical examination.

As regards the etiology and diagnosis of dyspepsia, I shall limit myself to a few remarks. I can state

from my own observation that all forms of dyspepsia are incomparably more frequent in this country than in Europe. The majority of all the patients who have come under my care in this country have had one or another form of chronic dyspepsia; even children seem not to be entirely exempt from it, and often exhibit an apparently inherited disposition to the disease. To explain these facts it is only necessary to take into consideration the history of this country and the mode of living of the people. The early colonists had no means of regulating their diet or properly preparing their food, two circumstances which constitute the principal causes of dyspepsia. The immigrants of the present day, the pioneers settling in the far West, labor under the same disadvantages. As a general rule, the culinary art is not yet sufficiently cultivated here; and we often find, even in some hotels, abundant and excellent provisions spoiled by bad cooking. In the cities, the busy life of all classes scarcely allows time for meals, so that people get into the habit of eating in a hurried way, and set the example to their children. Thus the food does not undergo the preliminary changes requisite for a prompt and thorough digestion, viz., mastication and intimate mixture with the saliva. The function of the latter must not be underrated, the diastatic property of ptyalin and the excitation by the alkaline saliva of an abundant secretion of healthy gastric juice being most favorable for the digestion. Moreover, some incorrect notions are prevalent among the public at large, which formerly were entertained by the profession, but are now abandoned owing to our advanced knowledge. Many people think that water ought not to be taken during digestion, because it dilutes the gastric juice; and this rule is most religiously observed by nearly all dyspeptics. And yet, experiments with artificial gastric juice show that food is easily digested, provided there is free hydrochloric acid and plenty of water, a minimum quantity of pepsine being sufficient to digest large quantities of food. Another fallacy, fortunately now losing ground, is the opinion that alcoholic stimulants are useful for digestion, which in reality are exactly the reverse; they disturb, retard, and check digestion, and by irritating the stomach constitute one of the most frequent causes of gastric catarrh. Again, some think that it is very healthy to eat in small quantities, but often. In exceptional cases, in persons with an impaired digestion, where only a small quantity can be digested at a time, we are obliged to give food often in order to support life. As a rule, however, sufficient time is requisite for the food to be thoroughly digested, and it is injurious to add perfectly undigested food to that which is in the process, perhaps in an advanced stage, of digestion. We know, from physiological researches, that by the gastric juice the albuminous substances of the food are transformed into soluble modifications—peptones—which are readily absorbed. But, until the peptones are removed by dialysis (absorbed), no new albumen can be thoroughly peptonized, nor can the peptones be absorbed in the presence of unmodified albuminous substances. It is, therefore, much better to take the necessary quantity of food at long intervals (three or four times in 24 hours), and entirely to abstain from eating anything between the meals.

The diagnosis of chronic catarrh of the stomach may offer some difficulty only in its advanced stages. One of the easiest means to ascertain the extent of dilatation of the stomach is to introduce into it effervescent substances (bicarbonate of soda and tartaric acid); the shape of the stomach is then made palpable and even visible. The next thing to find is whether the dilatation depends on the gastric catarrh, or whether they are both symptoms of a stricture at the pyloric part of the stomach. This is sometimes exceedingly difficult to demonstrate, and we mostly have to be guided by the previous history of the case (ulcer of the stomach, etc.), or by the presence of a tumor. The microscopic examination of the contents of the stomach, the palpation of the abdomen, the absence of ascites, diarrhœa, etc., must be taken into consideration when making the differential diagnosis of chronic gastric catarrh, cirrhosis of the liver, amyloid degeneration of the bowels, etc. Chronic gastric catarrh is frequently mistaken for cancer of the stomach. I know of a case where an elderly person was considered by her physicians to be suffering from cancer, which, however, was not found at the post-mortem, though during life the patient exhibited all the symptoms of carcinoma ventriculi, except the presence of a tumor. It must be borne in mind that the most prominent symptoms of cancer of the stomach depend on the accompanying gastric catarrh, and may not exist at all without the latter.

After having made the diagnosis of chronic catarrh, I employed formerly the treatment introduced by Kussmaul.* It consists in the methodical use of the stomach-pump, by means of which, at certain intervals, the stomach is entirely emptied of the stagnated food and the accumulated products of fermentation, and washed out with a weak alkaline solution (soda-water, Vichy). The patients are then given nourishing and easily digestible food in gradually increasing quantities. They are much benefited by this method, and are often ultimately cured of the gastric catarrh; but it requires the constant and prolonged attendance of the physicinn, and is extremely tedious and unpleasant to both. I have now adopted methods equally efficient, and in some respects much more so, and presenting none of the disadvantages mentioned.

In the earliest stages of dyspepsia the regulation of the diet alone is almost sufficient to arrest its further development. In the treatment of gastric catarrh, our special attention has to be directed to the circumstance that such patients generally abstain from a great many wholesome and digestible articles of food, and are apt to resort to that form of dieting which, in reality, is slow starvation, and which, when prolonged, results in the impairment of nutrition of the most important organs. I therefore recommend to dyspeptics a variety of articles of food (of course, excluding such as are indigestible), and prefer to correct the unpleasant symptoms they may call forth. It is far better to keep up the general strength of the patients, and treat the gastric symptoms, than in avoiding these latter to produce general anæmia and emaciation. It is not difficult to correct the gastric symptoms in the first stages of the disease; an occasional dose of magnesia or rhubarb, sometimes both together, or a wineglass of some bitter water (Friedrichshall, Hunyadi, etc.), taken at bed-time, will often answer the purpose. Even pure water taken repeatedly, subdues the symptoms by washing, as it were, the stomach, and removing the accumulated products of the catarrh.

Experiments on animals with gastric fistula show that the introduction into the empty stomach of an alkali immediately excites an abundant secretion of gastric juice. I therefore advise dyspeptics to take

* Kussmaul: Ueber die Behandlung der Magnerweiterung. Deutsch. Arch. für klin. Medicin. Bd. VI., p. 455.

Vichy water some time before their meals. About a tumbler before breakfast, and a much smaller quantity before lunch and dinner, and also to drink as much pure water as they like during and after the meals.

It is advisable to rest awhile after meals, muscular or mental over-exertion being injurious, because the supply of blood is then diverted to the muscles or nervous centres, whereas during digestion the stomach ought to be in a state of congestion. Therefore, rest should be taken after the principal meals, even a little sleep, in order to afford the stomach the greatest amount of blood necessary for its increased activity. Infants and animals instinctively follow this rule. On the other hand, substances in a state of fermentation, or which readily undergo fermentation, like beer, sweet things, etc., ought to be avoided, as also those substances which the stomach, affected by catarrh, is apt to produce itself—acetic, lactic, and butyric acids. Therefore, vinegar, bad milk, and especially rancid butter and fatty substances must necessarily be avoided. Unfortunately, such patients are sometimes even advised to take exactly the above-mentioned acids (vinegar bitters, lactic acid, etc.), in the supposition that the gastric juice is acid and contains lactic acid. But the acid which in the free state is always present in the normal gastric juice is hydrochloric acid; the lactic and other acids are produced by the chronic catarrh of the stomach, and rather interfere with the healthy digestion. One of the best remedies, and often quite indispensable in dyspepsia, is hydrochloric acid, diluted in water, which I prescribe to be taken after meals. Physiological experiments have proved that one to four parts of free hydrochloric acid to one thousand parts of the gastric juice are most favorable for the digestion, while only a trace of pepsine is sufficient, and can be utilized over and over again in the process of digestion, provided the necessary quantity of hydrochloric acid and water be added. In the great majority of dyspeptics, if not in all, there is a deficiency of hydrochloric acid in the gastric juice, which must be considered as the principal cause of the abnormal digestion. This is especially the case with anæmic persons or during the febrile condition. Manassein * experimentally demonstrated the deficiency of hydrochloric acid as being the cause of the deranged digestion during fever or anæmia. This acid, therefore, ought to be supplied to all patients affected with fevers, to anæmic persons, convalescents, and dyspeptics generally. The experiments of Manassein made by him on anæmic and feverish animals have also shown that food mixed with their gastric juice easily undergoes putrefaction if no hydrochloric acid is added. I found that common salt or substances containing salt—like oysters, for instance—are useful in dyspepsia, because salt is an antifermentative, and the chlorine of the salt during digestion is transformed into hydrochloric acid.

In the more advanced stages of the disease one of the principal indications is to check the morbid fermentation in the stomach. The experiments of Hoppe-Seyler on animals† have shown that the healthy gastric juice is one of the best antifermentative remedies, as it prevents cane-sugar from fermenting even in the presence of fungi. In treating, therefore, the gastric catarrh, our efforts must chiefly be directed towards re-establishing the secretion of the normal gastric juice. In order to arrest the fermentation, I prescribe, according to Botkin's recommendation, chlorine water * (freshly prepared according to the German pharmacopœia), to be taken several times a day, sometimes even every hour. It not only checks the fermentation, but, being ultimately transformed into hydrochloric acid—a natural constituent part of the gastric juice—it promotes digestion. After the disappearance of the morbid fermentation in the stomach, the chlorine may be substituted with advantage by the hydrochloric acid. Of late I have tried with good results to arrest fermentation by very small doses of thymol, but further observations are requisite to corroborate my first impressions. Quite recently I have used in one case, to be mentioned hereafter, salicylic acid, with a most excellent result. In some exceptional cases, when the food stagnates unusually long in the stomach, owing to an excessive dilation and loss of contractility of the stomach, or to a strictured condition of the pyloric portion, it may occasionally become necessary to use the stomach-pump, or give Carlsbad salt one or two drachms in a large quantity of warm water, administering it before breakfast in two or three doses, at intervals of ten or fifteen minutes. Instead of Carlsbad salt, a mixture of sulphate of soda eighty-five per cent., common salt twelve or fourteen per cent., and two or three per cent. of carbonate of soda, can be used with the same, and sometimes even with better effect. A solution of these salts stimulates the contractions of the stomach and the peristaltic motions of the bowels, causing several free passages, besides washing out the stomach and exciting the secretion of normal gastric juice, and thus promoting the digestion of the food now to be introduced. I need scarcely add that, until the disappearance of the gastric catarrh and the cessation of pain, some palliative may occasionally be administered—for instance, small doses of morphine, alone or in combination, with bismuth, etc.

One of the most important indications in the treatment of gastric catarrh is to reduce the dilatation of the stomach. Although with the abolition of the catarrh the stomach has a tendency to assume its normal dimensions, yet, owing to the atrophy of the muscular coat and its paretic condition, the diminution of the size of the stomach progresses very slowly, and the peristaltic contractions remain for a long time imperfect, thus causing the stagnation of food. Hence the great persistency of all the morbid symptoms, and the excessively protracted treatment, notwithstanding the employment of the most rational and efficient methods. As gastrectasia, in some degree, is always present in gastric catarrh (and also in hysterical gastralgia), I have introduced a special treatment of the dilated stomach.† It consists in producing contractions of the stomach by means of induced currents in the following manner: Both electrodes, in the shape of broad plates, are applied transversely (stabil) to the remotest portions of the dilated stomach. The current is gradually increased from minimum intensity to its maximum, and after several seconds' duration again diminished to its minimum. This is repeated fifteen to twenty times in succession, with a pause of several seconds between. Then the electrodes are applied to two other distant portions of the dilated stomach in a vertical or diagonal direction, and the current again alternately increased and diminished in the above described manner. In addition to these "fluctuating induction currents," I employ another method

* Manassein: Centralbl. f. med. Wis. 1871. p. 853.
† Hoppe-Seyler: Ueber den Einfluss des Zuckers auf die Verdauung und Ernährung. Virch. Archiv. Bd. X., p. 144.

* Botkin: Ein Fall von Stenosis pylori, etc. Berl. kl. Woch. No. 38.
† Neftel: Die Behandlung der Magenectasien beim chronischen Magencatarrh. Centralb. für die med. Wissensch. 1876. No. 21.

of "tetanizing induction currents" in the following manner: while the broad electrode is kept steadily at one portion of the dilated stomach (the current being of maximum intensity), the smaller electrode is suddenly pressed against the opposite portion during several seconds, then suddenly removed, and after a short interval again suddenly applied and removed, repeating this alternate applying and removal about fifteen or twenty times in succession. The electric treatment by means of one of these methods, or of both combined, is daily resorted to until the disappearance of all the morbid symptoms. The contraction of the stomach produced by this treatment can be ascertained by percussion, and by the immediate relief it affords, although this effect is not lasting from the first, and the stomach assumes its previous size; but the tone of the muscular coat soon improves from the repeated applications of the current, and the size of the stomach becomes ultimately reduced. Under the electric treatment the costiveness invariably disappears, thus indicating the increased tone and peristaltic motion of the stomach and bowels.

After the disappearance of the gastric catarrh, there remains for some time a torpid state of the digestion, caused very probably by insufficient secretion of the gastric juice. We know from the earliest observations made by Beaumont* and others, that in fever, for instance, no gastric juice is secreted, not even by the excitation of the introduced food. The consequence is that the food remains unchanged in the stomach during twenty-four or forty-eight hours. Something similar takes place in torpidity of digestion, as can be ascertained with the stomach-pump. (Leube in Ziemssen's Cyclopedia.) Physiological researches offer different means of exciting immediate and abundant secretion of the gastric juice, the most powerful stimulus being saliva; ether, cold water, alkalies, etc., belong to this category. But, in order to promote the secretion of a healthy gastric juice in a more permanent way, we possess other remedies, like bitters, nux vomica, and especially small doses of rhubarb. One- or two-grain doses of rhubarb, taken several times daily during several weeks, materially improve the digestion of such patients by exciting the secretion of a normal gastric juice. Large doses of rhubarb act more on the liver and bowels, and therefore do not answer the purpose.

With the disappearance of the gastric catarrh, and possibility of taking in sufficient quantities a variety of food, the general health becomes finally restored to its normal condition.

The chronic gastric catarrh, if not entirely cured, invariably results in anæmia, which may continue as an independent disease and be the origin of some grave and fatal affection: pernicious progressive anæmia, fatty degeneration of the heart, marastic thrombosis, etc. The anæmic condition can be successfully treated with preparations of iron, which I generally prescribe to be taken with the meals (from two to five grains of iron by hydrogen, two or three times a day, with the principal meals). The iron is then readily assimilated with the food, and the patient increases in weight and assumes a healthy appearance, in a remarkably shorter time than when given in the usual way. I continue during several months the use of iron in smaller doses (two or three grains), without causing the slightest inconvenience to the digestion.

The foregoing remarks contain the general principles which I follow in the treatment of dyspepsia, modifying them according to the peculiarities and requirements of the individual cases. From a large number of cases I offer here only a few illustrations.

Mr. B., of New York, 64 years old, was suffering from an aggravated form of dyspepsia during many years. Previous to the appearance of dyspeptic symptoms he enjoyed excellent health, and was very active. He worked hard as a builder, and, owing to his great energy and perseverance, accumulated a large fortune. With the rapid increase of means he could accordingly augment the amount and variety of food, without, however, allowing the stomach the necessary time for digestion, continuing to speculate in real estate and to work with enhanced energy and excitement. The result was dyspepsia, appearing first in a mild form, and in the course of years gradually assuming a most distressing character. He was treated by eminent physicians here and in Paris, receiving but slight and temporary relief. I examined him for the first time, July 12, 1873. He is of middle size, very well built, intelligent-looking, but exceedingly pale and emaciated. He complained of pain in the epigastrium, increasing after meals, and more especially at night, depriving him of sleep. He could take but a few articles of food, and in the smallest quantities, as even the simplest things in larger quantities invariably aggravated the suffering. He had constant eructations, and often vomiting, which somewhat relieved the pain, though for a short time. The bowels were costive, and moved only by taking cathartic pills. He felt very weak and chilly, the extremities were cold, he had dimness of vision, and occasionally tinnitus aurium. He often had attacks of vertigo, at times so severe and prolonged, and accompanied with such a sensation of faintness, that he was obliged to sit down, in order to avoid falling. On account of this vertigo and loss of memory, he had generally to be accompanied by his son, especially when transacting business, which at last he was on the point of giving up altogether. The epigastric and hypochondric regions were bulging out, the stomach much distended with gases, and its slow peristaltic motion could be plainly observed; the skin pale and cool; the temperature in the axilla 36° C.; the pulse weak, 46; respiration slow, 10 in a minute. Nothing abnormal could be detected in the thoracic and abdominal organs, except the dilatation of the stomach; no tumor. The urine scanty, slightly alkaline, contained no albumen or sugar, but a large amount of indican (tested with muriatic acid and calcium chloride). The sediment consisted chiefly of crystals of magnesium ammonium-phosphate. The vomited masses had an acid reaction and rancid odor. When left for some time in the test-tube, presented two, or rather three layers, the upper of a grayish color and frothy, containing, besides gas-bubbles, débris of food (fat-drops, muscular fibres, etc.), and becoming more voluminous after standing. The lower layers were brownish and darker at the bottom, where, besides some residua of food (amylaceous bodies), a large quantity of sarcina and other fungi were found under the microscope. In making the patient pass the gases evolved, by eructation, through a tube, they could be made to burn with a pale flame (hydrogen). A piece of coagulated albumen, after remaining for three hours in a test-tube filled with the vomited mass, was found almost unchanged (the edges slightly rounded). The vomited masses scarcely contained a trace of hydrochloric acid (tested with argentic nitrate), but a considerable amount of butyric acid (the distillate gave with baric hydrate the characteristic crystals), and of lactic acid (by Hoppe's method). There was

* Beaumont: Experiments and Observations on the Gastric Juice. Edinburgh, 1838. p. 99.

no alcohol in the vomited masses, which continued to ferment in the test-tubes, as indicated by the increased volume of the upper frothy layer. By adding different antifermentative substances (permanganate of potash, borax, camphor) to separate portions of the vomited masses, it could be observed that hydrochloric acid, and still better, chlorine, decidedly checked the fermentation, and pieces of coagulated albumen would become entirely dissolved. It was evident from the chemical and microscopical examinations that the dilated stomach of the patient was the seat of fermentation; moreover, by the presence of butyric acid, hydrogen, and the absence of alcohol, it could be specified as butyric acid fermentation.

It remained yet to decide whether the fermentation was caused simply by gastric catarrh, or whether this latter, together with the fermentation, was called forth by stenosis of the pylorus; and if so, whether the stenosis was the result of a cicatrix or of a tumor within the walls of the stomach or in some adjacent organ, and merely pressing upon the pylorus. The previous history of the patient, who at no time had any symptoms of ulcer of the stomach, excluded the cicatricial stenosis, and the long duration of the disease made the existence of a malignant tumor improbable. Accordingly, I began treating the patient as if affected with simple gastric catarrh, reserving the prognosis on account of the indican in the urine. At that time I had the opportunity of observing a number of cases with cancerous deposits in the liver and other viscera, who all had a large amount of indican in the urine.* The recent researches of Jaffe † and Senator ‡ have shown that indican may be present also in various other diseased conditions. I prescribed the solution of Carlsbad salt in divided doses, to be taken before breakfast (on the first day only), and strong, freshly-prepared chlorine-water every hour. I also advised him to drink pure water with and between the meals, and treated him with induced currents. Besides applying the electrodes to the stomach in the way above described, I applied them also to the hypogastric region, in order to stimulate the activity of the bowels. The electric treatment was continued daily, and so was the chlorine (every two hours). The pains, eructations, vomiting, became less intense and less frequent, and soon entirely ceased. The appetite improved from the very beginning of the treatment, though under my advice he had to increase very gradually and cautiously the amount and variety of food. With the abolition of pain he slept soundly, and his general health steadily improved. After the disappearance of the symptoms of fermentation the chlorine was left off, and hydrochloric acid prescribed, to be taken with water after each meal. A mixed diet was then allowed, with the exception of salads, sardines, fatty and other indigestible substances, and at the end of the month the patient considered himself almost well. There remained, however, a considerable degree of anæmia, general debility, and a slight weakness of digestion, occasionally calling forth some pain, and a tenderness and swelling in the epigastric region. I ordered one-grain doses of rhubarb four times a day, and continued the treatment with induced currents—at first daily, and then every other day. After two months' treatment, the general health of the patient was in an excellent condition. He felt strong, could walk long distances, and the sleep, digestion, and bowels became quite normal. Together with this treatment, and on account of the marked cerebral symptoms, I employed galvanization of the brain, according to my method described in the *Archiv für Psychiatrie und Nervenkrankheiten*. Bd. VIII., p. 409. The patient still continues in excellent health, and never complains of either dyspeptic or any cerebral symptoms.

I will now give an instance in which the cerebral symptoms were the principal object for treatment, while the dyspepsia to which they were due was considered of secondary importance.

Mrs. R., fifty years old, a cultivated lady of high standing in society, complained principally of a sensation of faintness, as if the head were swimming. This sensation recurred quite frequently, and at times lasted so long that she was obliged to sit down to prevent falling. After evacuation of the bowels, which almost always had to be produced artificially, she invariably felt quite faint and had to remain in a recumbent position for an hour or more, though there was no local pain in the rectum, and neither a fissure nor piles. She suffered besides from general debility, being unable to take food in sufficient quantities, because it produced pain and swelling in the epigastrium, and frequent and loud eructations. She had to exclude a great many articles of diet, as they always increased the distressing symptoms. She was therefore reduced to the simplest food in insufficient quantities. Owing to the judicious advice of her physician, and the great care the intelligent lady observed in her diet, the dyspepsia was kept in check during a great many years, her principal complaint being vertigo, headache, fainting fits, and other cerebral symptoms.

On examination, Nov. 17, 1873, I found considerable emaciation and anæmia, the stomach moderately dilated. I prescribed a full dose of calcined magnesia at bed-time, and the chlorine to be taken every two hours, and commenced the electrical treatment of the dilated stomach and torpid bowels, and the galvanization of the head. At the same time I advised her to eat a variety of articles of food in considerable quantities, and should this diet produce indigestion, to correct it by a dose of calcined magnesia. In about a fortnight I substituted hydrochloric acid for chlorine, and, as an after-treatment, prescribed small doses of rhubarb, and finally iron. The result of this treatment was entirely successful; the dyspepsia and cerebral symptoms vanished, the patient gained flesh, and her general health became excellent in every respect.

I shall briefly relate the following case, to show the beneficial effect derived from the use of salicylic acid as an antifermentative in chronic catarrh of the stomach.

Mr. M., an elderly gentleman with a good constitution, but for many years a prey to gastric catarrh, consulted me Oct. 31, 1875. The dilatation of the stomach was moderate, though the gastralgic pains were often intense. Being a resident of Massachusetts, he could only occasionally be treated for a short time, and therefore could receive but temporary relief. Two years previously he had an attack of inflammatory rheumatism, which kept him in bed for nearly two months, and since then was several times threatened with a return of the disease. I prescribed for him salicylic acid, to use in case of another attack. Last year he became ill with inflammatory rheumatism accompanied with high fever, and after suffering intense pains in the inflamed and swollen articulations

* Neftel: Die electrolyt. Behandl. bösart. Geschwülste. Virchow's Arch., Bd. 57, p. 242.
† Jaffe: Ueber die Ausscheidung des Indicans, etc. Virchow's Arch., Bd. 70, p. 72.
‡ Senator: Ueber Indican und Kalk Ausscheidung, etc. Berl. klin. Woch., 1877, No. 43.

during twenty-four hours, he decided to try the salicylic acid according to my prescription. He took eight-grain doses every hour, beginning in the morning, and towards evening the pains, swelling, redness and fever almost entirely disappeared. During several days he took salicylic acid three times a day, and found to his great amazement that with the disappearance of the inflammatory rheumatism the dyspeptic symptoms had also subsided, so that he was able to eat larger quantities and a variety of food, and gained flesh. He still continues to be in remarkable good health.

The two following varieties of acute gastric catarrh present a peculiar interest—the one often leading to the chronic form, and the other being of great diagnostic importance.

The first appears in a most acute form, and is accompanied with intense gastralgic pain. It attacks, sometimes, persons who were previously in good health, or had but very slight dyspeptic symptoms. After prolonged excesses in diet, especially when coupled with a liberal use of alcoholic liquors, the patients are attacked with nausea, vomiting, and violent pains in the stomach, which increase in the night and prevent them from sleeping; there is a complete loss of appetite, costiveness, vertigo, and headache. This condition may continue for days and weeks, and finally pass into the chronic form of gastric catarrh, if the acute attack is not radically cured. The accompanying headache and vertigo often arouse suspicion of a brain affection, were it not for the acute gastric symptoms, which are ascribed to inflammation of the stomach.

Gen. ——, a strong and formerly very healthy gentleman, during the last five or six years indulged greatly in eating and drinking. Being very popular, he was often called upon to attend dinners, where, besides the abundant courses, wine was partaken of in profusion, and cigars smoked. After one of such gastronomic dinners he was attacked with nausea and vomiting, followed by intense pains, which kept him awake all night. Notwithstanding the remedies employed (mostly homœopathic), the gastralgic pain, nausea, vomiting, and want of sleep continued during four weeks. I saw him for the first time, Aug. 14, 1873. Besides the above-mentioned symptoms, he complained of headache, vertigo, eructations, and costiveness. The tongue was red, the abdomen tender in the epigastric and right hypochondric regions, the stomach was distended, the liver enlarged. I prescribed Carlsbad water (Sprudel), to which was added Carlsbad salt, to be taken before breakfast, and the chlorine every hour, besides the treatment with induced currents of the stomach and bowels. All the morbid symptoms, including costiveness, disappeared in a few days, so that he could resume his business, continuing for some time the electrical treatment, the diluted hydrochloric acid, and finally only the small doses of rhubarb. A year later, owing to excesses in diet, he had a new acute attack, but was promptly relieved by the same treatment. Last year a similar attack befell him in the country, where he suffered intensely during several weeks, and recovered only after coming to New York and resuming the treatment.

I would call the attention of the profession to similar acute gastric attacks which appear periodically in persons suffering from locomotor ataxia and other affections of the spinal cord. Of late, Charcot * has described them in his admirable work under the name of *crises gastriques* or *gastralgiques;* but I believe that these attacks are still very little known, and not even mentioned in many text-books on diseases of the stomach, thus giving cause for great diagnostic errors. The case I here relate is not only of a theoretical interest, but of great practical importance. It teaches for the first time, so far as I know, that the periodical acute gastric attacks may exist for years before the appearance of any other symptom of locomotor ataxia. These attacks are therefore of the greatest value as an early premonitory symptom of most dangerous affections, the development of which may thus be prevented by an appropriate treatment.

Mr. C., 46 years old, *came under my care* February 9, 1877, affected with locomotor ataxia in a very advanced stage. He has a good constitution and is of healthy parentage, married twelve years, has three healthy children, and was formerly in good health. Before his marriage he was much addicted to drink and excessive venery, and even the first year after his marriage he continued to use alcoholic liquors until about eleven years ago, when he gave them up after an attack of intense gastralgic pains and incessant vomiting, lasting for about a week. Five weeks after his recovery he had another attack, and since then the gastric attacks appeared periodically, at first every five weeks, and afterwards oftener. During the attacks he remains for several days prostrated with intense gastralgic pain and incessant vomiting, takes no food at all, and passes sleepless nights. These very acute symptoms gradually subside in the course of a week or ten days, when his digestion becomes again normal, and remains so until the appearance of another attack. These gastric attacks were for a long time ascribed to inflammation of the stomach, and treated accordingly, but afterwards they were considered as a simple gastralgia, and therefore more successfully managed. Several years later, in addition to the gastralgic attacks, he commenced to suffer intense neuralgic pains in the lower extremities, and after awhile also in the upper ones. They always alternated with the gastralgic pains, so that with the appearance of the gastric attack the excruciating pains in the extremities subsided. These latter were considered as rheumatism, and, after numerous remedies were tried in vain, the patient was sent to hot springs, where he remained during a summer and winter. There his locomotor co-ordination, his sight and hearing became very much impaired, and he returned home in a greatly aggravated condition. He then consulted different specialists, who all declared the disease to be a well-marked case of locomotor ataxia, though the gastric attacks were still considered as a simple gastralgia, and in no connection with the sclerosis of the cord. He is now treated by me with the galvanic current, under the influence of which the sight, hearing, and locomotion have greatly improved, the neuralgic pains have disappeared, and the gastric crises occur but seldom (once in several months), and in a very mild form.

The so-called *crises gastriques* may accompany not only locomotor ataxia, but also other diseases of the spinal cord, like central myelitis and multiple sclerosis in their earliest stages—therefore, at a time when these diseases can yet be more successfully treated. The last case proves that these gastralgic attacks may even precede the development of the spinal disease, and thus become a most valuable premonitory symptom of the approaching danger. It is evident, therefore, that the early recognition of their true nature is of the greatest practical importance. Unfortunately, they are scarcely ever recognized, and thus give rise to great diagnostic

* Charcot: Leçons sur les maladies du système nerveux. Part I., p. 82, and Part II., p. 266.

errors. And yet these gastric attacks present some characteristic peculiarities which always make the diagnosis possible and often easy. Thus, the attacks appear periodically, during the intervals of which the digestion is quite normal or nearly so; they are accompanied or followed by the neuralgic pains of the extremities peculiar to tabetics (*douleurs fulgurantes*). During the attacks the pulse is accelerated, but the temperature remains normal. Later there is incipient impairment of sensibility, vision, and locomotor co-ordination, etc. In some exceptional cases the gastralgic attacks and a slight impairment of vision (or merely a tendency to fall when the eyes are closed) are the only symptoms of locomotor ataxia, the real nature of which may thus remain unrevealed for a long period of time.

Before dismissing the subject, I wish to make one more remark concerning the electrical treatment above described. Being employed in conjunction with other remedies, it is not evident how much of the result of the treatment has to be ascribed to its influence. The following case seems to prove that the electrical treatment is an important factor in reducing the gastrectasia, and removing the atonic condition of the bowels.

Mrs. W., æt. 43, wife of a physician in Montgomery, Ala., placed herself under my care in September, 1874, for the treatment of habitual constipation of twenty years' standing. The dyspeptic symptoms were kept in check by the judicious treatment of her husband; the dilatation of the stomach was moderate, but the costiveness baffled every treatment, and the bowels could not be moved without a cathartic. Her husband sent her to New York solely for the electrical treatment, having satisfied himself that internal remedies, of which she had already taken great quantities, did not modify the habitual costiveness. I was therefore enabled to observe in this case the effect of the electrical treatment alone, applied in the above described manner. The result was a permanent cure of the costiveness and of the dilatation of the stomach. The anæmic condition was subsequently treated with iron.

In conclusion, I will sum up the foregoing in a few propositions.

The local effects of the chronic gastric catarrh are:

1. Fermentation in the stomach (butyric acid), with evolution of gases (inflammable) and formation of fatty acids (butyric, lactic, acetic).

2. Dilatation of the stomach (gastrectasia) and impairment of its peristaltic movements.

3. Stagnation of the food in the stomach and atonic condition of the bowels.

4. Gastralgic pains and vomiting.

The general effects of the gastric catarrh are emaciation and general anæmia from the defective nutrition of the system, especially anæmia of the brain, causing vertigo and other cerebral symptoms.

The diet of those affected with chronic gastric catarrh, though simple and easily digestible, must not be too uniform, and pure water can be used ad libitum.

The principal indications in treating chronic gastric catarrh are:

1. To arrest the fermentation (by antifermentatives —chlorine, thymol, salicylic acid, hydrochloric acid, etc.).

2. To treat the gastrectasia and the atonic condition of the bowels with induced currents.

3. To excite the secretion of a healthy gastric juice by the use of alkaline waters, small doses of rhubarb, bitter remedies, etc.

4. To improve the digestive properties of the gastric juice by the administration of hydrochloric acid, not only in dyspeptics, but also in anæmic persons generally, and in those affected with fevers, and in convalescents.

It is of the utmost importance to diagnosticate early the gastralgic pains (*crises gastriques*), which sometimes accompany, or even precede, the development of locomotor ataxia and other diseases of the spinal cord.

On the early diagnosis depends the possibility of preventing or curing these organic affections of the spinal cord.

TREATMENT OF STOMATITIS MATERNA.

By E. P. HURD, M.D.,

NEWBURYPORT, MASS.

The pathology of this affection, which is sufficiently common in the experience of general practitioners, is obscure; is seen in patients who seem to be well in other respects; is generally an index of lowered vitality; sometimes an inflammation, the result of local nutritive disturbances of reflex origin, the irritation being mammary. In the ptyalism of pregnancy we see an instance of the same etiological kind.

Stomatitis materna takes the form of acute or chronic oral catarrh, also aphthous and ulcerative stomatitis.

It is sometimes very obstinate and intractable. Weaning the child always brings about a speedy cure. It is, however, generally amenable to treatment of a simple nature. Where, from lowered vitality, a tonic regimen, as quinine, porter, iron, and cod-liver oil is required, there are two preparations of the latter in the market, which I find almost equally serviceable—Scott's Emulsion and Phillips'. Many, however, can take Phillips' oil that cannot take Scott's. Phillips' oil is borne by the most delicate stomachs. I consider this preparation invaluable for nursing women whose nutrition is below par.

Nursing sore-mouth will often yield to astringent gargles, or mouth-washes. Chlorate of potash is good in this affection, as in all other oral affections of an inflammatory and ulcerative nature.

The glycerite of tannin, a great favorite of Ringer in all these complaints (see his *Handbook of Therapeutics*, page 300), is sometimes all the application that is needed—to be brushed over the parts affected twice or three times a day. Where astringents alone will cure, this will cure.

The sulphites, especially the sulphite of sodium, the sulpho-carbolate of sodium, are recommended. The sulphite of sodium may be given internally in doses of a scruple three times a day, and also used as a mouth-wash. The same dose (℈i.) may be given of the sulpho-carbolate of sodium, and, dissolved in an ounce of water, used as a gargle. These medicines undoubtedly have an alterative effect, as well as a local action (see Braithwaite, Part 63, page 24).

The tincture of smartweed (*Polygonum punctatum*) in drachm doses, diluted with water, to be taken internally, and used as a gargle, is highly recommended by a writer in the *Philadelphia Medical and Surgical Reporter*. Another authority regards bismuth, in ten-grain doses, as a certain remedy.

In several obstinate cases I have used the following formula with good results. (The formula is borrowed from the *Reporter*.) In one case cure followed in less than a week, but during its use the baby, previously well, was severely griped and purged. I think that it should be used with much caution, and discontinued in a few days if it does not seem to do good, or if it

affects the baby injuriously. The dose of the biniodide is about one-thirtieth of a grain:

℞. Hydrarg. biniod ..... gr. v.
Pot. iod ..... gr. x.
Aquæ ..... ℥ j.
M. Ft. sol. liq.

Take three to five drops, ter die, after meals. For a mouth-wash, add six drops to a tablespoonful of water.

This remedy, besides its local stimulant and resolvent action, undoubtedly does good as an alterative, improving local and general nutrition.

A CASE OF SPURIOUS HERMAPHRODISM IN THE MALE.

By W. E. WHEELOCK, M.D.,

NEW YORK.

In January, of this year, during my service as house physician in Bellevue Hospital, a case of spurious hermaphrodism in the male came under my notice. The patient came to the office for examination, at the out-door department, gave a history of pudendal disease of some sort, and was sent to the hospital with a permit for admission to one of the uterine wards.

Upon admission to the hospital the patient gave the following history: Age, twenty-three years; birthplace, England. When a child, noticed that her genitals were somewhat unlike those of the generality of her sex. At the age of thirteen years, while reaching to light the gas, felt something slip from the abdomen into the right labium majus, which slipped back again when she lay down. At the age of fifteen began to have a leucorrhœal discharge, more or less of which she has had ever since. Never has had any discharge of blood from the vagina.

The patient was here closely questioned, and it was impossible to obtain a history of any series of symptoms occurring at intervals of a month, or thereabouts, which could point to any attempt at the establishment of the function of menstruation, either normal or vicarious. At the age of eighteen years, married, but has never been pregnant. Is very fond of children, and has adopted a little boy, to whom she is much attached. Came to the hospital on account of a painful swelling on the right side of the vulva, which does not annoy her much while she is in a recumbent position, but which occasions much distress when she attempts to walk.

Upon a hurried examination the patient's trouble seemed to be an abscess of the right vulvo-vaginal gland. A more careful examination showed that the patient was not a female, but an imperfectly developed male, who, however, certainly thought himself a woman. The following notes of the case were then taken: The patient is of medium height and weight; the face and head are of male size and shape; the facial expression is decidedly masculine; there is a delicate moustache upon the upper lip; the hair of the scalp is coarse and long; the voice is boyish and husky; the shoulders, chest, trunk, pelvis, and upper and lower extremities, especially the hands and feet, are decidedly male in type; there seems to be an entire absence of mammæ.

What at first sight appeared to be the clitoris is in reality a penis two inches long, with two corpora cavernosa, a glans, corona glandis, fossa, and prepuce; there is no corpus spongiosum. The penis is possessed of moderate erectile power. Below the penis are two folds, which resemble closely the labia majora of the female, but they are smaller, and apparently contain much less adipose tissue; between them is a cavity which resembles the vagina, but it is not more than two and one-half or three inches in depth, and grows smaller from without inward, tapering to a point, where it ends in a blind cul de sac. The lining membrane of this cavity, near its apex, is the seat of a slight ulcerative process, which probably is the cause of the discharge which the patient described as leucorrhœa. On the right side, in the fold which resembles so much the labium majus, is a body as large as an almond, which resembles precisely, in shape and feel, the testis of a boy; it, and the tissues in its immediate vicinity, are inflamed and tender to the touch, presenting very much the appearance of an inflamed Bartholin's gland. It was for this that the patient sought medical aid.

In the left groin is found another body precisely similar to the one just mentioned, which, being severely compressed, the patient complained of a sickening pain in the epigastrium. During the examination this body slipped from under the finger into the fold on the left side, but was easily pushed back into its former situation in the groin. The next day, however, while the patient was standing, it slipped again into the fold, where it became inflamed, and where, on the following day, it presented all the features observable on the opposite side. In the light of this examination, the following additional points in the patient's history were with some difficulty obtained.

For a month or two after marriage suffered from dyspareunia; after that time this symptom disappeared. During coitus has a well-marked sexual orgasm, preceded by turgescence of the penis, attended at its height by an ejaculation, and followed by a sense of lassitude. On one occasion, after a six weeks' absence of the husband, had an orgasm and ejaculation during sleep.

A more minute physical examination was determined upon, but the patient, on account of a quarrel with another in the same ward, insisted upon leaving the hospital, and consequently received his discharge.

In order to prove beyond controversy that the patient was masculine, it would have been necessary to have determined, with the aid of the microscope, that the fluid ejaculated during sexual excitement was a product of the male sexual apparatus, or that the testiform bodies referred to above were testes. It so happened that neither could be done.

There can be no doubt, however, that the patient was a male. The build, voice, absence of uterus, entire absence of any attempt at menstruation, and the presence of organs which could scarcely be other than testes, make this evident.

A hasty examination seemed to reveal the presence of a vagina and labia majora, but the pseudo-vagina was rather a hiatus than any organ in particular, and the arrest of fœtal development which occasioned this absence of tissue in place of the male perineum had also given the appearance of labia majora to the two halves of the scrotum, which normally are united in the median line; this fact was made further apparent by the presence in each apparent labium of what was, without doubt, a testis.

Yet, singularly enough, this individual lived happily with a husband for five years, neither of them being aware of his sex, and showed an almost womanly instinct in adopting an infant, and in having it constantly in his society.

In an article on Hermaphrodism, the late Sir James Y. Simpson has quoted among others a case very similar to the above.

Progress of Medical Science.

PILOCARPIA.—At the first stated meeting of the Therapeutical Society of New York, Dr. A. Jacobi read a paper on the alkaloid of pilocarpus jaborandi, based on over sixty carefully observed administrations of the drug. The dose was one-third of a grain, given hypodermically—a solution in water, one to fifty, being used. Its principal laurels will be reaped in the desquamative nephritis of scarlatina, in the parenchymatous nephritis of diphtheria, and in acute and chronic nephritis generally. There is no doubt but that a complete diaphoretic effect is, with rare exceptions, obtained with more regularity by this, than by any other diaphoretic, even the hot pack. Sufficient doses appear to affect all the integuments, both those covered with cylindrical and pavement epithelium. Rosenkranz and Froumüller gave one grain, and this quantity may be required in pleural, peritoneal, and pericardial effusions, perhaps in œdema glottidis; but, as collapse has been observed, large doses should be given carefully. One of the principal effects of the drug is the lowering of arterial pressure, as demonstrated by the experiments of Kahler and Loyka. These observers consider the administration to be contra-indicated in valvular disease of the heart, especially where no compensation has taken place. These theoretical conclusions, however, do not fully correspond with experience, and will, therefore, have to be re-examined.

USE OF THE CHLORIDE OF POTASSIUM IN EPILEPSY.—At the second stated meeting of the Therapeutical Society of New York, Dr. E. C. Seguin read a paper on the use of chloride of potassium in epilepsy. He was led to experiment with this drug by the assertion of Prof. Binz, who considered the sedative effects of bromide of potassium to be due to the potassium, and who suggested the use of the chloride as containing a greater proportion of the mineral. Dr. Seguin's conclusions, based upon a large experience, are:

1. That chloride of potassium is not efficacious in the treatment of epilepsy.

2. That the bromides are positively useful in reducing the number and severity of epileptic attacks.

Observations have also been made upon a mixture of chloral and the bromides, and the following deductions drawn:

1. The epileptic attacks are warded off quite as well by this as by bromides alone.

2. The reflex power of the throat has been abolished quite as well as by the ordinary bromic solution.

3. There has been remarkable immunity from the bad effects of the bromides, more especially those which manifest themselves in the psychic sphere.

4. No really bad effect resulting from this mixture has been noticed. A more extensive trial of this combination in epilepsy is recommended.

CONTRACTION OF THE PALMAR FASCIA.—Dr. Baum, of Dantzic, reports two cases of the affection to which the above name was given by Dupuytren, which were cured by means of Busch's operation (see MEDICAL RECORD, No. 318). In both of the cases the wound healed rapidly, without reaction, and the functional result was perfect. Dr. Baum believes that the deformity in these cases of contractured finger is due to an affection of the skin and not of the fascia. He has found by numerous experiments on the normal hand, that retraction of the palmar fascia has but little effect in preventing extension of the fingers, while an equal retraction of the skin will absolutely prevent such extension. He has been unable to find in preparations of normal fingers the connective-tissue bridles depicted by Goyrand in v. Pitha's "Krankheiten der Extremitäten," and regards them as pathological growths, developed, not from the fascia, but from the skin, as the result of chronic inflammatory processes excited by persistent pressure. In the palm of the hand, it is true, numerous connecting bands run between the skin and the fascia, and hence it is difficult to decide to which of the two strata any thickened bands belong in this situation. In a few well-authenticated cases of contracture of the thumb, however, the palmar aponeurosis was not implicated, and as in these cases we are forced to admit that the cause of the contracture was situated in the skin, it is fair to conclude that in the hollow of the hand also the cutis is the part affected. Dr. Baum attaches little importance to the case described by Richer (see RECORD, No. 350), as he believes that a more careful study would have shown that the skin was not really normal. He claims that Busch's operation itself furnishes an argument that the cutis is the part affected. The triangular flap of skin raised in the operation retracts to such an extent when the finger is extended, that it can no longer be brought back to its original position, an evident proof that the skin is shrunken. Both of Baum's cases recovered with perfect fingers, although no orthopædic treatment to secure extension was subsequently employed, and Madelung's case was also successful, although the patient withdrew from observation soon after the operation.—*Centralblatt für Chir.*, March 2, 1878.

A CASE OF MELÆNA VERA NEONATORUM.—Dr. Wigert, of Liegnitz, reports a case of this rare disease, which began twelve days after birth. The mother was a delicate, phthisical woman, with a tendency to hemorrhages; she was unable to nurse the child. The blood was vomited and passed per anum, but there was no hemorrhage from the mouth, nose or throat. Death took place on the eighth day from broncho-pneumonia. An autopsy could not be obtained. This case is remarkable from the fact that it did not develop until twelve days after birth. Of the forty cases tabulated by Silberman (medical literature only contains forty-two recorded cases of the affection), the disease appeared in thirty-four during the first three days of life, and in all of them during the first eight days. Silberman ascribes melæna vera to the following causes:

1. To ulcerative processes in the digestive tract, caused by embolism, the emboli originating in the vena umbilicalis, according to Landau.

2. To ulcers caused by extravasation of blood into mucous membrane of the digestive canal, the extravasation itself being caused by obstructed respiration.

3. To anomalies in the structure of the vascular walls, in connection with the increase of the blood-pressure in the left ventricle and the entire aortic system that takes place immediately after birth.

4. To an obstruction of the venous circulation, or capillary hemorrhages, which may be caused by vomiting, enlarged spleen, suspension of respiration, or atelectasis pulmonum.

The lack of an autopsy renders it impossible to decide positively what was the anatomical change at the bottom of Wiggert's case, but the history of the case and the condition of the mother render it probable that the melæna was symptomatic.—*Allg. Med. Cent. Zeit.*, March 2, 1878.

THE MEDICAL RECORD:

EXPERT TESTIMONY.

THE recent trial in Jersey City for wife poisoning naturally engrossed a great deal of the attention of the public. The medical profession also has had reason to be interested, especially in the expert testimony which was offered on either side to establish the fact whether or no antimony had been administered to the supposed victim. At first the case appeared to be a very clear one, and it was difficult to understand how the defence could counteract the weight of evidence against the prisoner. It soon became apparent, however, that the most promising line of argument against the prosecution was the initiation of a quarrel between the experts, and a consequent muddling of the real points at issue. Altogether, the proceeding illustrated, in a very forcible manner, the necessity for some change in the manner and method of offering expert testimony. We do not pretend to pass judgment upon the absolute value of the testimony of either side; it is enough to say that each was right so far as the pure facts were concerned, and yet, one is flatly contradicted by the other as to results. Both theories, the one for the prosecution, that of poisoning by antimony, and the one for the defence, that of a gouty affection of the stomach, were explainable by the symptoms from which the patient was said to have suffered. It was quite possible, by some of the tests employed by the prosecution, to discover antimony even in small quantities, and quite impossible when those tests were not employed, to be sure that antimony was not present. It was also possible that antimony existed at one time in the urine and not at another. Further, the amount of tolerance of the poison differs so much in different individuals and under different circumstances that almost anything can be proved with regard to it. So far as these facts could create any doubts in favor of the prisoner, he was legally entitled to their benefit. They were sufficient of themselves to give the defence the advantage without inviting an issue between the two principal experts.

And here, while we deplore the circumstance, we take occasion to point the moral. There is, in a word, too much one-sidedness in the whole matter. This fact was quite apparent in the recent trial. Instead of being mere exponents of the plain truth, the impression is almost irresistible, that each expert was retained to support his side of the case at all hazards. This may be perfectly proper from a legal, but highly improper from a scientific standpoint. The fact that it is a custom is no argument in its favor. It is well known that there are medical men in this and other cities who can be bought to testify as experts whichever way their attorneys may dictate. Aside from cheapening professional opinion and prostituting it to unworthy purposes, we maintain that these experts exceed their privileges, are more like advocates than witnesses, and that their opinions are practically valueless because naturally biassed.

Pet theories, personal pride, professional conceit, and all selfish motives of appearing to advantage before a jury should be subservient to the single purpose of exposing the "truth, the whole truth, and nothing but the truth." The accomplishment of the latter can hardly be guaranteed so long as such experts are paid by either side, and this brings us naturally to the point of suggesting a remedy. The latter can, we think, be found in the selection by the court of a commission of experts which shall give testimony for either side when called, and who shall be looked upon more as an advisory than as a prosecuting or defending element in the case. The experts would then have a single motive for discharging a simple duty, would have no reason to quarrel over the value of particular methods of investigation to champion theories, or lend themselves to insinuations as to the professional standing of each other. The responsibilities of all such issues belong to the attorneys, and may safely be left with them. In the eyes of the law they can interpret the facts as they may desire, but the true business of expert testimony is to present such facts above the suspicion of any bias whatever.

If some such provision for expert testimony could be made, it is not difficult to understand how much substantial benefit would grow out of it. The court could act more intelligently, the profession could appear to better advantage, real experts would come to the front, the jury would be better able to grasp the salient points in a given case, and there would be no occasion for pitting one professional man against another, or of purposely destroying the real value of the testimony by artful cross-examination or legal quibbling over side issues.

COLOR-BLINDNESS.

THE reliable statistics which have been collected in regard to the prevalence of color-blindness, strongly

confirm the assertions of those who have for years past urged upon the marine and railway authorities the necessity of a full recognition of the danger of permitting those having this defective vision to exercise duties involving the interpretation of colored signals. There appears to be little difference of opinion among scientists in regard to the manner in which color-blindness develops itself. A large proportion cannot distinguish red color; next comes those who are green-blind, and lastly a few who are violet-blind. The difficulty appears to be that whereas the normal eye reduces its color-sensations to three, and analyzes white light into three elements, the color-blind eye reduces its color sensation to two, and analyzes white light into two elements. Thus if a person is red-blind, he cannot distinguish that color from green; or, if blue-violet blind, that color from yellow; or, if green-blind, that color from red.

To estimate the public importance of this question, it must be remembered that the color-blind individual may be the engineer of a train, running nearly a mile a minute to make up time, and that the passengers' lives, not to speak of their property, are dependent upon his knowledge whether a switch is open or shut, by his instantaneously distinguishing between a red and a green light. This example may be sufficient to rouse the community to a sense of the danger which exists from this curious defect of vision, but we would also refer to the fact that pilots and officers of ships often hold the lives of hundreds of persons in the balance, on their power of immediately determining whether a light ahead is green or red.

We therefore are happy to second the efforts of those who are now urgently recommending railroad managers and the marine service to make such regulations that all employees shall give satisfactory evidence that they are free from the defect of color-blindness; and to those who have authority to promote such results so important for the public safety, we commend a pamphlet recently written by Dr. B. Joy Jeffries (Harvard), who has carefully brought together the leading facts bearing on this question, and supplemented them with interesting and valuable statistics.

Dr. Jeffries very properly recommends that all candidates for positions, requiring the use of normal color perceptions, should be examined by *an expert*. Many of the color-blind are aware of their defect, and for the purpose of maintaining their positions, educate themselves to conceal the fact from others; they learn the names of colors, and by the help of outward signs, with a keen perception of gradations of light and shade, they supply their want of sensibility by the exercise of judgment. Therefore, in testing one who is color-blind, we must take away the chances of employing any of those outward characteristics which he is wont to make use of according to long experience. A remarkable case in point, which occurs to us at this moment, is that of a Mr. W. Butcher, who was put early in life to the carpet trade, and shortly after discovered that he was color-blind. By close observation he made himself acquainted with the proper names of color, and thus kept the defect from those about him. By educating his eye to the peculiar *warmth* imparted, when all the colors in carpets were said to harmonize, he was enabled to raise himself to the position of salesman in a large house of business. As a matter of fact he could not distinguish reds and scarlets from greens and browns, orange and yellow he could select with ease. This case ultimately ended in *white atrophy*—that is, the blood supply to the optic nerve and retina was cut off, and he is now quite blind. It will be thus seen that the mere test of naming colors cannot always be relied on, and that a more thorough and systematic examination is necessary.

Dr. Jeffries concludes that *one* person *in fifty* is color-blind in some degree, and suggests that *one* in *twenty* may be nearer the mark; an examination of other authorities rather confirm us in the opinion that the latter figures of Dr. Jeffries are the most correct. Dr. Wilson examined 1,154 persons at Edinburgh and found 1 in 55 confounded red with green; 1 in 60 confounded brown with green; 1 in 46 confounded blue with green; hence *one* in nearly *every eighteen* had this imperfection.

We have here called attention to the large percentage of color-blindness that exists, the public danger that is ever present in consequence, and the remedy necessary to mitigate the evil. Past experience affords us small hope of relief without special Legislative enactments, we therefore trust that, during the next meeting of Congress, a law shall be passed compelling all railroad corporations to examine their employees, and test them for color-blindness by an expert competent to detect it. The same examination should be carried out amongst pilots and masters of ships. These latter should also be especially instructed how to detect color-blindness among the personnel of their command.

THERAPEUTICAL COMMITTEES IN STATE SOCIETIES.

THE practice of reporting upon questions of therapeutics, as it prevails in the meetings of the Medical Society of New Jersey, is one which deserves imitation by other similar organizations. As will be gathered by a perusal of our report of this Society in another column, the plan is to obtain all the possible information upon the action of remedies, the prevalence and character of epidemics, etc., and condense the same into some general conclusions. Although the latter are only to a limited extent of value, they form the groundwork of observation which is of the greatest utility to the general working practitioners.

BODY-SNATCHING.

IT is exceedingly unfortunate that a recent case of body-snatching in Cincinnati should have gained such

a wide notoriety, and should have been the occasion of so much newspaper discussion. Viewed even from the standpoint which might be assumed by an enthusiastic and adventurous student of anatomy, it was an entirely unnecessary and stupid proceeding. It is just such ill-considered actions as these that bring disrepute upon the profession at large, and which tend to prejudice the public against the best directed efforts for scientific advancement. In regard to the matter of dissection, the law has made very generous concessions to scientific medicine, and anything which would tend, as in the instance before us, to jeopardize a good understanding, deserves the severest rebuke. The subject is one the contemplation of which is always repugnant to the ordinary mind, and the less it is discussed the better for those who are interested in the permanency of the present laws. It is true in some of the smaller colleges anatomical material is very difficult to obtain and is very expensive, but that is no excuse for robbing neighboring graves or of running any similar risk.

THE PENNSYLVANIA STATE SOCIETY.

The Pennsylvania State Medical Society was largely attended, and many important measures were adopted. Among the latter may be mentioned those referring to preliminary education and the study of medicine. Our satisfaction at the stand taken is not, however, disassociated with the misgiving that the resolutions may after all become a dead letter. Far from us be it to prejudge the result, but we are only governed in our conclusions by the experience of other organizations in which similar rules have been adopted. It has been found that such regulations would work very well in small towns and sparsely settled districts, but in our medical centres they are almost of necessity practically ignored. And then the medical colleges themselves give not the slightest heed to such requirements. But we are willing to await the results of the experiment. The adoption of the metric system by formal vote is a step in the right direction, as is also the recommendation for the appointment of female physicians in insane asylums.

Vesico-Vaginal Fistula and Calculus in Vagina.—Dr. W. L. Kelsey, of Willington, Ct., writes: M. Storrs, M.D., of Hartford, Ct., operated in April, 1876, for vesico-vaginal fistula upon a lady in this town. She has been perfectly free from urinary trouble since then. About the first of last March she came to me complaining of leucorrhœa; upon examination a calculus was found in the vagina; it measured one and one-half inches in length, about an inch in width, and an inch in thickness. It was formed around the cicatrix, and was concave anteriorily. The line of cicatrix was plainly seen through the centre, and the depressions made by the sutures. It is a perfect cast of the anterior wall of the vagina. There is no leakage from the bladder, as water was injected in April, 1878, and none came through. She and her father have both been treated for vesical calculus.

Reports of Societies.

MEDICAL SOCIETY OF THE COUNTY OF NEW YORK.

Stated Meeting, May 27, 1878.

Dr. J. C. Peters, President, in the Chair.

COMMITMENT OF THE INSANE—THE DICKIE CASE.

Dr. Charles H. Nichols, Superintendent of the Bloomingdale Insane Asylum, read a paper, in which he gave a detailed history of the case of Miss Susan Dickie, who, in accordance with the verdict of a jury, was removed from that institution after having been confined as a lunatic more than six years. In discussing her mental condition Dr. Nichols reached the conclusion that while Miss Dickie was insane an element of imbecility ran through the entire history, and he was inclined to the opinion that it was the result of "natural weakness and supervening disease." The evidence of insanity, founded upon expert authority, was then reviewed. There were thirteen witnesses; of those eleven were of the opinion that she was insane, and two that she was sane. Dr. Nichols believed that the finding of the jury was directly against the preponderating weight of testimony; that a jury of non-professional men were entirely incompetent to judge correctly in such cases; that the statements made by Drs. Hammond and Clymer, to the effect that attendants upon the insane were particularly liable to become insane, were untrue and fallacious; that the association of insane persons, under proper classification, was beneficial; and that the influence of association with the insane was not unfavorable.

The paper was accepted by the Society, and being open to discussion,

Dr. Edward Bradley, as one of the commissioners in the Dickie case, proceeded to answer some of the statements made by Dr. Nichols. The evidence in the case was somewhat extensively reviewed, and special symptoms were commented upon at some length. The father stated that Miss Dickie, since her removal from the asylum, had not had a delusion, an illusion, or an hallucination; that she purchased her own clothes, furnished and cared for her own rooms, and was economical with her money, and cleanly in her habits; that she had no guardian, but managed her own affairs, simply being guided to a certain extent by the advice of her friends.

Dr. James W. Ranney referred to the family history of Miss Dickie, to the relation which he had sustained to the case, and believed her to be just what he stated in his testimony before the Court—namely, a woman small in stature and in intellect, but not a lunatic.

There being no further business, the Society adjourned.

Remedy for Oxyures Vermiculares.—M. Morelli has found hydrate of chloral efficacious against the oxyuris vermicularis. He prescribes it by enema, his formula being: Chloral hydrat., ʒ i.; glycerinæ, ʒ xv. —*Lyon Médical*, May 5th.

[N. B.—A drachm of chloral to ʒ xv. seems a heavy dose, but it reads so in the French.]

MEDICAL SOCIETY OF THE STATE OF NEW JERSEY.

One Hundred and Twelfth Annual Meeting, at Spring Lake, N. J., May 28 and 29, 1878.

(Special report for THE MEDICAL RECORD.)

DR. H. R. BALDWIN, OF NEW BRUNSWICK, N. J., PRESIDENT, IN THE CHAIR.

FIRST DAY, TUESDAY, MAY 28TH.

THIS Society held its Annual Meeting in the Monmouth House, at Spring Lake, on Tuesday and Wednesday, May 28th and 29th. The President, Dr. H. R. Baldwin, presided. All the other officers and a full delegation from all the district medical societies in the State were present, as was also a large number of fellow and honorary members. Dr. Crandal, of the Medical Society of New York, was the only delegate present from corresponding societies.

After the reception of the report of the Committee on Organization and the transaction of regular routine business, the remainder of the evening was devoted to the reading of the Annual Address of the President, which was an elaborate paper on Contagious Diseases and Suggestions for their Prevention.

SECOND DAY, WEDNESDAY, MAY 29TH.

The Society reassembled at nine o'clock, Wednesday morning.

The Chairman, Dr. Wickes, read the report of the Standing Committee.

The health of the State at large had not been so good as shown by the report of last year, the prevailing diseases being the malarial and exanthematic fevers, with diphtheria, typhoid fever, and dysentery as epidemics in various parts of the State; with these are reported the usual number of the diseases of the seasons.

THE THERAPEUTICS OF DISEASE — AN INTERESTING SUMMARY.

In noticing the lessons afforded by the reports upon the therapeutics of disease, we find that in an endemic of dysentery in Burlington County the ipecacuanha treatment was practised, and in *all the* cases successfully. In the same county the eucalyptus globulus arrested intermittent fevers which would not yield to the preparations of bark. It was also used successfully by one practitioner as a dressing in offensive ulcers, or any offensive discharges.

The Reporter for Bergen commends cocoa-butter by inunction for allaying fever-heat and stimulating the capillaries, seeming to protect them from cold. The mouths of the pores are not occluded as by oil or grease. He uses it freely in scarlatina every three or four hours during the continuance of the fever. In the treatment of malarial affections an observer in Bergen relies almost entirely upon cinchonidia sulph. as equal, in its influence on the disease, to quinine. He gives fifteen grains of the former where he would administer ten grains of the latter, and, when given in the form of a pill, he believes that it does not produce any more nausea than quinine. In his own case he found that, while taking it in large doses, it produced feelings of great depression, with undue palpitation of the heart. In dysentery the same report recommends injections of nitrate of silver, ten grains to the ounce, in infants as well as adults. In one case of dysentery, in a child of seven years, the intestine could be distinctly felt distended with fecal matter; pain almost constant, and the abdomen was exquisitely tender.

The application of a blister over the lower half of the abdomen was followed by the largest discharge the doctor had ever seen in a child of that age.

In the treatment of facial erysipelas the reporter confidently recommends the application of lard, applied with a brush or swab. The lard should be melted sufficiently for its application, and the parts smeared and covered with cotton wool; the process to be repeated every ten or more hours, according to the severity of the symptoms. In Cumberland County salicin has been used in rheumatic affections, with the best results, in some cases after the failure of other remedies. Cinchonidia sulphate has been used in the place of quinine satisfactorily as a tonic, febrifuge, and antiperiodic. In the treatment of diphtheria, salicylic acid, combined with equal proportions of quinine, has been used with excellent results. In Morris County the cheaper alkaloids of cinchona have proved as efficacious as quinine in arresting the paroxysms of malarial diseases. The use of jaborandi is recommended by one observer. He says: "Its sialogogue and sudorific properties in the treatment of acute and chronic Bright's disease, or in any morbid condition in which the secretion of the skin requires stimulating, commends it as especially desirable; I rely upon it as infinitely superior to any other remedy of its class.

The Committee proposed two questions for responses from the Reporters:

1st. Is consumption contagious?

2d. What is the proper alimentation of infants?

To the first question there were three classes of respondents.

1st. Those who think that it is contagious. These numbered two or three.

2d. A few who believe that it may be contagious.

3d. Those who do not regard it as contagious, and who make up the great majority of the profession.

Answers to the second question differed with the residence of the physician — the county and city manifesting each its peculiar needs. The mother's milk is generally conceded to be the best for the infant. But, even when this is abundant, it may be disadvantageous for the individual living on it, and a substitute be necessary. Country practitioners recommend cow's milk as the best substitute, while many in cities and towns speak highly of condensed milk. Of the preparations so various and so highly commended by those who put them on the market, the Imperial Granum seems to hold the first place in the estimation of medical observers. All agree in condemning the use of nursing-tubes as unclean even with the best of care.

The following gentlemen died during the past year, on the dates mentioned:

Stillman E. Arms, Elizabeth, æt. 78, July 10. 1877.
Thomas F. Cullen, Camden, æt. 56, Nov. 21. 1877.
Charles Hasbrouck, Hackensack, æt. 59, Nov. 25, 1877.
James B. Coleman, Trenton, æt. 71, Dec. 19, 1877.
John H. Philips, Beverly, æt. 64, March 1, 1878.
John C. Sutphin, Plainfield, April 13, 1878.
Charles Laird, Manasquan, æt. 29.

The report of the Committee on the Early Annals of New Jersey Medicine, which contained memorial notices of over three hundred physicians, was received and referred to the Committee on Publication.

The Committee on Alcohol as a Medicine reported by its chairman, Dr. Ryerson. The committee was continued, and increased by the addition of two members, Drs. Parrish and Lilly, and requested to continue the prosecution of the subject.

OPIUM INEBRIETY.

Dr. Mattison, a former resident of the State, being present, by invitation, read a very practical and interesting paper on Opium Inebriety. The paper will be published with the Transactions of the Society.

Dr. Dougherty, of Newark, read a very exhaustive and instructive paper on Observations on Glucosuria.

Dr. Deshler, of Hightstown, also read an interesting paper, the subject of which was "The Medical Profession and the Public Health."

For the want of time, a paper by Dr. Ryerson, of Newton, on Rectification of Abnormal Fœtal Positions was received without being read, and referred to Committee on Publication.

Prof. Lewis A. Sayre, M.D., of New York, was elected an Honorary Member.

It was voted that the annual assessment for the members of the district societies be two dollars per capita.

Dr. H. G. Taylor, of Camden, was appointed essayist for the next annual meeting.

OFFICERS ELECT.

The following were elected as the officers for the ensuing year: *President*, Dr. John S. Cook; *Vice-Presidents*, Drs. A. W. Rogers, A. N. Dougherty, and L. W. Oakley; *Corresponding Secretary*, Wm. Elmer, Jr.; *Recording Secretary*, Wm. Pierson, Jr.; *Treasurer*, W. W. L. Phillips; *Standing Committee*, S. Wickes, S. Lilly, and I. L. Bodine.

Delegates to American Medical Association for next year: Drs. S. Lilly, C. I. Kip, H. A. Hopper, D. M'Lean Forman, H. W. Elmer, D. Warman, I. E. Arrowsmith, C. H. Voorhees, R. L. Disbrow, A. W. Rogers, F. W. Owen, I. W. Snowden, G. W. Terriberry, C. W. Dunham, Lloyd Wilbur, C. Shepard.

Delegates to Pennsylvania: G. H. Tanson, H. G. Taylor, Edgar Holden. *Delegates to New York:* T. J. Thomason, I. L. Bodine, I. W. Hunt. *Delegates to Connecticut:* D. W. Silvers, F. Gaunt, A. Clendenin. *Delegates to Rhode Island:* S. C. Thornton, C. Shepard, M. Abel. *Delegates to Massachusetts:* E. M. Hunt, C. V. Gorden, John W. Ward. *Delegates to Maine:* F. Wilmarth, Wm. Elmer.

The Society adjourned to meet next year at the Palisade House, Englewood.

MEDICAL SOCIETY OF THE STATE OF PENNSYLVANIA.

Annual Meeting at Pittsburg, Penn., May 29th, 30th, and 31st.

(Special report for The Medical Record.)

Dr. D. Hayes Agnew, of Philadelphia, President, in the Chair.

First Day—Wednesday, May 29th.

The Medical Society of the State of Pennsylvania assembled at Liberty Hall in the city of Pittsburg, on Wednesday afternoon, May 29th, at three o'clock. The meeting was called to order by Dr. B. B. Mowry, of Allegheny, the retiring President. Prayer was offered by the Rev. Dr. Felton, of Pittsburg. The President elect, Prof. D. Hayes Agnew, of Philadelphia, was then introduced and took the chair.

T. I. Gallaher, of the Committee of Arrangements, introduced Dr. Calvin B. King, of Allegheny, who delivered the address of welcome. The speaker welcomed the delegates to the "Second City of the Commonwealth, the Birmingham of America." After alluding to the needs of a higher standard of medical education, and referring to the project for a State Board of Health, he closed with an eloquent reference to the many eminent members of the profession in and near Pittsburg.

The Committee on credentials then reported a list of delegates who were accepted as properly accredited.

Dr. Woodbridge, of the State Medical Society of Ohio was invited to the platform and introduced.

PAPERS READ.

Reports of delegates to other societies were then received from Jos. G. Richardson, M.D., of Philadelphia, delegate to the New York State Society, and then from Dr. B. Gillett, delegate to the same body at a previous session.

S. W. Gross, M.D., read a paper on the "Treatment of Venereal Diseases." Dr. J. T. Carpenter, of Pottsville, read a paper on "The Local Origin of Constitutional Diseases." This paper was discussed at some length by Dr. Wm. Pepper, of Philadelphia.

Dr. Wm. Asdale, of Pittsburg, exhibited a remarkable case of tolerance of the presence of foreign bodies by the brain. Dr. J. B. Murdock, of the same city, read a paper on "Observations on a Rare Form of Dislocation of the Hip." He also gave the history of the very extraordinary case which had formed the subject of his paper.

Dr. Dyer, of Pittsburg, then read a paper on "Sympathetic Ophthalmia." This paper, with the others above mentioned, was referred to the Committee on Publication.

A report from the Commission on Form of Revision of the United States Pharmacopeia, was likewise referred, as was also a paper from Dr. Seguin, of New York, on "Uniformity in Physic."

The Society then adjourned until 8 P.M.

PRESIDENT'S ADDRESS.

Dr. Lawrence Turnbull, of Philadelphia, Vice-president, presiding, the President, Dr. Agnew, delivered an address on "Errors of Diagnosis." He spoke of the difficulty of getting at the real nature of things. Then, after illustrating the danger arising from the neglect of proper tests in the investigation of disease, the speaker referred to errors of diagnosis which arise from visual defects. The evil consequences resulting from a slight neglect may also be seen in an omission to uncover the parts which are to be the subject of examination. Prof. Agnew then gave a number of examples, showing that a large proportion of errors might be placed to the account of ignorance, and then made some observations upon the fact that errors of diagnosis not unfrequently originate perplexing litigations. When the President had concluded his address, the Society adjourned for the day.

Second Day—Thursday, May 30th.

The Society met at 9 A.M., Dr. Agnew presiding. First in order was the reception of reports from county societies. Then followed discussion of resolutions on "Medical Education," submitted by a committee appointed to consider the subject. The resolutions were as follows:

PRELIMINARY EDUCATION AND MEDICAL STUDY.

Resolved, That every member of a County Medical Society organized, or which may hereafter be organized, under the regulation of the Medical Society of

the State of Pennsylvania, before receiving any person as a student of medicine, shall require him to enter into a contract to pursue his studies for a period of not less than three years; and it shall be the duty of his preceptor to present him with a certificate, countersigned by the secretary of the local society, setting forth the facts as above stated.

Resolved, That it shall be the duty of all members of the profession holding allegiance to the Medical Society of the State of Pennsylvania to recommend their students to attend only such medical colleges as rigidly enforce the full three years' course of study.

Resolved, That all County Societies existing under the regulations of this Society, or which may be hereafter organized, shall, at the next meeting, elect officers, and annually thereafter be required to elect three members, to be called Medical Examiners, whose duty it shall be to examine all applicants for admission as students of medicine under the tuition of members of this Society; and said committee shall withhold their certificate from any applicant unless he is of good moral character, and possesses a good English education and a sufficient knowledge of Greek and Latin to enable him to pursue his studies with advantage. And no member of any County Society shall receive any person as a student of medicine unless he present a favorable certificate from the Committee.

The general conviction of the delegates was that the preliminary education of students had not been sufficiently considered by the profession. Dr. Pollock said that the plan proposed had been in operation in Alleghany County for ten years, and had been found to work well.

Dr. James McCann, of Pittsburg, offered an amendment to the first resolution extending the course of study from three to four years, and in support of it remarked that the number of students graduating each year is entirely too large. The effect of the amendment would be to decrease the number.

The amendment was defeated, and the resolution was then adopted. The Secretary, Dr. W. B. Atkinson, of Philadelphia, was directed to forward a copy of the resolutions to the Association of American Medical Colleges, which would meet in annual session at Buffalo the following week.

MEDICAL REGISTRATION IN PENNSYLVANIA.

Dr. R. L. Sibbett, of Carlisle, from the Committee on Medical Legislation, presented their report. Thus far registration of the doctors had not commenced in any part of the State, as required in Section 3 of the Act of Assembly of March, 1877, requiring members of the medical fraternity to register in Prothonotaries' offices their names, and the colleges from which they graduated. This failure to register is on account of the perspicuity of the section. Additional legislation having been deemed necessary, the Committee prepared and laid before the Legislature a memorial in which they recommend that the medical profession begin to register as soon as possible. No further effort will be necessary, as the Prothonotary, who is to receive a fee of $1.00, will see that all practitioners register.

The report was accepted and adopted.

Dr. S. D. Risley, of Philadelphia, gave a clinical history of 103 cases of iritis, treated at the University Hospital of Philadelphia. Dr. O. H. Allis, of the same city, lectured on Hernia, illustrating his points by crayon drawings. He advocated the early use of the knife in strangulated hernia. Dr. Shoemaker, of Philadelphia, delivered a very interesting address on "Roseolæ." Prof. Wm. Goodell read a paper on "Obstetrics."

Dr. Toner, of Washington, was here announced by Dr. H. C. Wood as an Ex-President of the American Medical Association, and on his motion was admitted to a seat on the platform. The Society then adjourned until 2.30 P.M.

OFFICERS ELECT.

When the Society reassembled in the afternoon, the first business was the reading of the report of the Committee on Nominations, etc. The officers selected for the current year were as follows: President, Dr. James L. Stewart, of Erie; Vice-Presidents, J. T. Carpenter, Schuylkill; William Goodell, Philadelphia; A. M. Pollock, Pittsburg; Permanent Secretary, William B. Atkinson, Philadelphia; Recording Secretary, J. N. Kerlin, Delaware; Corresponding Secretary, O. H. Allis, Philadelphia; Treasurer, Benjamin Lee, Philadelphia.

The Committee on Publication is unchanged, with the exception that Dr. Kerlin is substituted for Dr. Coffee.

The delegates selected to attend the American Medical Association were eighteen in number. Among them were Drs. William Pepper and S. W. Gross, of Philadelphia.

The next place of meeting was fixed at Chester, Delaware County, Pennsylvania, on the last Wednesday of June, 1879.

THE METRIC SYSTEM IN PENNSYLVANIA.

Dr. E. Dyer, of Pittsburg, read a paper on the propriety of adoption by the medical profession of the metrical system, and offered the following resolution:

Resolved, That the Medical Society of the State of Pennsylvania, recognizing the advantages of the metric system from its universality, simplicity, and scientific character, does recommend the use of the same to the members of the Society, and urges them to familiarize themselves with it, and to advise their students to use it exclusively when they commence their medical career.

Dr. Green offered as an amendment, "That in all communications made to the Society, in which reference is made to weights and measures, the metric system only shall be used." This was adopted.

Dr. Murdock moved that the Society recommend the teaching of the metric system in the public schools.

MISCELLANEOUS PAPERS.

Dr. A. H. Halberstadt, of Pittsburg, read a paper on "The Use of an Anæsthetic in Parturition;" Dr. C. K. Mills, of Philadelphia, a paper on "Nervous Diseases;" Dr. John S. Dickson, of Pittsburg, "Notes on Two Cases of Ovariotomy."

Dr. John Curwen, of the State Lunatic Asylum at Harrisburg, read a paper on the cure and treatment of the insane.

FEMALE ASSISTANT SUPERINTENDENTS IN INSANE ASYLUMS.

Dr. Hiram Corson, in accordance with a resolution of the Society, made a report "On Female Assistant Superintendents in the Female Department of Insane Asylums," taking strong ground in their favor, and regarding them, when properly educated, as eminently fitted to take care of the insane of their sex.

Accompanying the report was a resolution, that a committee of seven be appointed by the President of the Society to memorialize the Legislature to enact laws, if any be needed, to authorize the employment, by managers of hospitals, under the control of the

State, of women medical superintendents for the female departments of said hospitals, and for hospitals to be erected for the accommodation of females.

The resolution was adopted.

INFLAMMATION OF BILE-DUCTS.

DR. WM. PEPPER, read a paper on "Jaundice from Inflammation of the Bile-Ducts." These cases, he said, often occur in acute form, but even more frequently they assume a chronic form, when they present all the features of severe disturbance of the action of the liver. In both forms spells of hepatic colic are apt to occur. There is a close relationship between catarrh of the bile ducts and the formation of gallstones. A number of illustrative cases were given. The mode of treatment includes a most rigid attention to diet, to dress, and to avoidance of exposure. He employs prolonged counter-irritation over the liver, the continued use of certain natural saline mineral waters, and the careful internal administration of the nitrate of silver in minute doses.

DR. BENJAMIN LEE, of Philadelphia, delivered an address on Hygiene.

DR. A. M. POLLOCK declined with thanks the position of Vice-President, for which the Committee had nominated him.

The Financial Report showed the receipts from all quarters as $2,604 49; the expenditures at $1,739 08.

DR. JAMES MCCANN, of Pittsburg, read a paper on "Clinical Observations on the Excision of the Joints, with Special Reference to the Elbow Joints."

The Society then adjourned.

In the evening a reception and supper was given to the delegates by the Allegheny County Medical Association, at Liberty Hall. The attendance was very large.

THIRD DAY—FRIDAY, MAY 31ST.

The Society met at 8 A.M., President Agnew in the chair.

EPILEPSY AND INSANITY.

DR. GREEN, of Easton, offered the following, which was adopted:

Resolved, That county societies be requested to report, during the present year, the proportional number of epileptics who, within their knowledge, become insane, and report to Dr. John Curwen, who is hereby appointed a committee to report on this subject to the State Medical Society.

MEDICAL LEGISLATION.

DR. W. B. ATKINSON, of Philadelphia, of the Committee on State Board of Health, reported that they presented to the State Legislature the bill to create a State Board of Health in Pennsylvania, together with an address on hygiene, but they regret to state that the bill was not considered in the Legislature. The Committee, however, express their belief that it will finally become a law.

DR. I. H. FISHBURNE offered the following:

Whereas, Physicians are frequently compelled to serve as witnesses in our courts of justice in cases involving medico-legal questions, in which their opinion as experts is required at the hands of the court; and

Whereas, There is no provision in the laws of Pennsylvania for the protection of physicians in their right to give or withhold a professional opinion while on the witness-stand, or for securing a just compensation for the same; therefore

Resolved, That the Pennsylvania State Medical Society be earnestly requested to take such action as they may deem expedient to bring this subject before the Legislature at Harrisburg, and to urge upon them the enactment of some law to protect the members of the medical profession from urgent and burdensome duties for which they receive no compensation in our criminal courts.

The following Committee on Addresses was appointed: Dr. Fleming on Medicine, Dr. Charles T. Hunter on Surgery, Professor Ellerslie Wallace on Obstetrics, Dr. R. A. Cleemann on Hygiene, and Dr. Reed on Mental Diseases.

Resolutions of regret upon the death of Dr. Wm. M. Wallace, of West Philadelphia, a former President of the Society, were adopted.

DISCIPLINE BY COUNTY SOCIETIES.

DR. A. B. BRUMBAUGH submitted the following, which was adopted:

Resolved, That the members of each County Medical Society are the only proper and reliable judges of the professional character and standing of medical men in their respective counties.

DR. AGNEW, the President, then introduced the new President, Dr. Stewart, to the Society. After a speech by the new President the Society adjourned to attend a reception at the Western Pennsylvania Hospital for the Insane, at Dixmont.

Correspondence.

RAPID LITHOTRITY, WITH EVACUATION.

TO THE EDITOR OF THE MEDICAL RECORD.

AN article by Dr. Keyes, in your last issue (May 18th), gives me occasion to refer to one or two misapprehensions which pervade his allusions to "Modern Lithotrity," as he is kind enough to call the new operation for stone.

In this article, which is devoted mainly to a description of the jaws of a lithotrite, the writer states that my lithotrite "must sometimes clog," because "it is made on the principle of Reliquet's." He is here doubly mistaken. In the first place, with regard to the fancied resemblance between the instruments: lithotrites are of two kinds, one fenestrated, the other with a solid floor. Reliquet's is fenestrated; mine is solid. In the second place, as an ascertained fact, my lithotrite does not impact, the male blade being furnished with alternate notches forming inclined planes by which the detritus is extruded right and left, except where a minute portion at the heel is driven through a slot by a long and effective spur. The latter, which reaches the outside, also serves to brace the heel of the male blade. Reliquet's non-impacting lithotrite is identical with the obsolete fenestrated *brisepierre*, with the addition of teeth in the opening below to insure pulverization. Dr. Keyes proposes to remove these added teeth, and return to the *brisepierre à mors fenêtré* (*porte à faux*) of Charrière. (*Nouveau Dict. de Méd. et de Chir.*, t. 20, Paris 1875, p. 667.) In fact, he goes back to the flattened jaws of the "slightly indented and fenestrated or open female blade" figured by Costello (*Cyclopæd. of Pract. Surgery*, vol. iii., pp. 50, 21, London, 1861), with a male blade small as in the usual lithotrite, to avoid

pinching the mucous membrane;* in short, a common lithotrite with the floor removed.

I am gratified to find that the writer of the article endorses my statement (which is an important corollary of the new system) that "*in future it will be no longer essential to pulverize the fragments, but only to comminute them.*" This may be accomplished by either a fenestrated or a solid instrument. Any fenestrated lithotrite that reduces to the size of a small opening the fragments driven through it, enables them also to pass the evacuating tubes, the use of which characterizes the new method. But, although instruments of this class will doubtless do well enough with small stones, as does indeed the usual lithotrite, my objections to a fenestrated instrument, of which I considered and rejected several (including that proposed in your journal), are these:

1. Sharp fragments, while firmly engaged in the opening, or driven through it, are likely to injure the floor of the bladder. During a long operation, such as I have proposed, it is hardly possible to prevent the frequent contact of the floor of the bladder with the extremity of the instrument, which, instead of protecting the mucous membrane, as usual, by a rounded and polished surface, is then fortified with protruding splinters of calculus, always impinging upon the same region of the floor.

2. The sides lack the mutual support afforded by an uninterrupted floor of metal; and if made low enough to be readily accessible to fragments (which is important), are consequently liable to break, especially should the strain come on one of them. The strength of a fenestrated blade lies in the height of its sides, and is but partially compensated by their breadth—unless the latter is extreme, and the male blade narrow. If it be wide, the corresponding opening not only impairs strength, but delivers large fragments.

3. Now, although fragments pass the tubed urethra readily, dust and small debris pass more readily, and first. So that, when a fragment has been fortunately seized, the operator loses time if he declines to crush it, as happens when he drives it through a fenestrated blade, to be again seized. Although, by the new method, pulverization is no longer essential as before, our aim is still to accomplish a maximum disintegration at each closure of the jaws; and this is better done with a solid upper and lower jaw than after the fenestration of either of them. A non-impacting instrument is very desirable; but not at the sacrifice of efficient and rapid crushing, or the integrity of the mucous membrane.

I may add that, to prevent impaction, such a projection of the male blade below the female blade as Dr. Keyes has devised and emphasized for this purpose (a description of which indeed occupies a considerable portion of his paper) is quite unnecessary. It is sufficient that the blades of a fenestrated instrument occupy the same level at the outlet.

Again, the heel of the instrument figured in your journal resembles the segment of a circle. Such curved blades admit fragments, and crush them, at great disadvantage.

Blades should be

1. As straight,
2. Set at as nearly a right angle with the shaft,
3. As little rounded at the heel,

as is compatible with their introduction.

In my non-fenestrated lithotrite, the blades are nearly straight, while the triangular notches deliver on alternate sides. This lateral action not only clears the jaws, but makes their hold very tenacious. It also secures to the blades the incidental advantage that they grind while they crush.

Dr. Keyes finds my instrument too large (or, as he says, "clumsy"). It is made large with a distinct object, viz., to break larger and harder stones than have been hitherto considered to be within the province of the lithotrite. It comminutes, with safety to the bladder, and without impaction, as no lithotrite hitherto devised has done. The new method of treatment is grounded in the fact that the normal urethra admits larger instruments, and is a readier road to the bladder than the lithotritist had hitherto recognized. The operator soon becomes not only accustomed to the use of a large lithotrite, but reluctantly foregoes the power it gives him, even when the stone is small. Collin has, however, made a second size.

While the power possessed by this lithotrite and the fact that it does not impact are its more important features, and especially adapt it to the requirements of the method now proposed, almost as useful is the change in its lock. I believe that this will be ultimately adopted by those not already educated to the old system, because it is based upon the readiest movements of the hand and wrist.

But a modification of the jaws and lock of the lithotrite is but an inconsiderable feature of the proposed new method. Rapid work is, indeed, thereby facilitated; and an empty instrument can be safely withdrawn as often as the operator likes, to relieve the bladder of what will come through the tubes, and so clear the way for more rapid crushing.

A far more important point to the lithotritist is *the comparative harmlessness of long sittings*, which was unsuspected, as I think, until the publication of my paper. When this was once under experiment, what was wanted was not so much an improvement of the existing crushing apparatus, as *an efficient means of evacuation*, capable of removing all the débris at one sitting. For this purpose, the large tubes criticised in your journal are absolutely indispensable. Their use is precisely what makes the new operation practicable, and is, with their manipulation, perhaps its chief innovation. The set of tubes described in my paper range from 27 to 31; but they can be procured of any smaller size, and should, of course, in any case, be adapted to the previously ascertained calibre of the urethra. It will, however, be found that the efficiency of the tubes diminishes very rapidly with their size, and that cases complicated by stricture, or by small meatus, will require an enlargement by which the introduction of a large tube may be made possible. In such a case as that reported, where the urethra only admitted a No. 20 instrument (French), and in which the writer of course found my largest tubes too large, I should prefer to increase the size of the passage, rather than to attempt extraction through the small calibres formerly in use, even though the tube were otherwise modified as I have recommended. With a normal urethra I do not believe that the tubes supplied by Tiemann will be found any too large.

The change proposed in the new procedure, and its advantages, will appear in a clearer light if we consider the limitations of the usual dilatory method explicitly acknowledged, quite recently, by both Sir Henry Thompson and Sir James Paget. These distinguished authorities gave their opinion that lithotrity should be restricted to stones requiring two or three, or at most three or four sittings, of two or three minutes each. Larger stones, in their opinion, do

* The mucous membrane would be more secure if care were taken always to blunt, or round a little, the edge of the sole of the male blade.

better if cut, such adult lithotomy resulting, however, in a mortality of one in three. It should be added that while lithotrity was thus pronounced unsuccessful in such cases, all attempts at the immediate evacuation of debris had hitherto resulted in practical failure.

The new method both crushes and immediately evacuates by the urethra calculi exceeding in size the limits hitherto affixed to crushing alone. This is done under ether, in a sitting of one or two hours' duration, or even longer. So far, its results have been better than could have been anticipated—being sixteen or seventeen cases of complete evacuation, with but one death—against one in thirteen by the usual method. Several of these patients would have been, by accepted rules, subjected to lithotomy, and therefore to a risk equal to one death in three cases. I cannot but think that, with due care in its application, the method now proposed will be found to yield results at least as favorable as those before obtained.

The following are the chief points connected with the modified lithotrity:

1. The calculus, although not necessarily pulverized, is crushed as rapidly and completely as is practicable. The dust and fragments are immediately evacuated, and a serious source of irritation is thus removed.

2. This can be generally effected in a single operation.

3. This operation—performed of course under ether—may be, if necessary, of one or two hours' duration, or even longer.

4. The method applies to larger stones than have been hitherto considered to lie within the province of the lithotritist. It also applies to nuclei, phosphatic deposits, and foreign bodies.

5. Evacuation is best accomplished by a large tube, preferably straight—with a distal orifice, arranged to facilitate its introduction and, during suction, to repel the bladder-wall—and by an elastic exhausting bulb which acts partly as a syphon.

6. The best size for the tube is the largest the urethra will admit.

7. Such a tube is introduced with facility, if passed vertically as far as it will go towards the anus before changing its direction, and afterwards directed almost horizontally, and turned like a corkscrew through the triangular ligament.

8. A small meatus should be enlarged, or a stricture divulsed to allow the passage of a large tube.

9. Unless the bladder be small, a large and powerful lithotrite is better than a small one.

10. That this may have room for action, the escaping water should be replaced occasionally, by a tube inserted a few inches in the urethra by the side of the lithotrite.

11. To save time, and also to prevent undue distention of the vesical neck, a non-impacting lithotrite is desirable. The jaws of a non-fenestrated lithotrite will not impact if the male blade is furnished with alternate triangular notches to discharge the debris laterally, and also with a long thin spur at the heel fitted to a corresponding slot in the female blade—provided the floor of the female blade, especially at the heel, be raised nearly to a level with its rim. To repel the bladder the female blade should be longer, and a little wider, than is usual. It should have also low sides accessible to fragments; relying for strength less upon these, than upon a central ridge below the heel. In the male blade of such a lithotrite, the apex of the triangles should be a little blunted. Lastly, a non-fenestrated female blade protects the floor of the bladder during a long sitting. A fenestrated instrument directs sharp splinters against it.

12. In locking and unlocking a lithotrite repeatedly in a long operation, it takes less time and is easier to turn the right wrist, as in my instrument, than to displace the thumb of either hand in search of a button or a lever, as in previous instruments.

HENRY J. BIGELOW.

BOSTON, May 25th.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from May 26 to June 1, 1878.

By direction of the Secretary of War, a Board, to consist of Surgeons E. P. VOLLUM, B. J. D. IRWIN, and Asst. Surgeon H. LIPPINCOTT, is ordered to meet at the U. S. Mil. Academy, West Point, on June 11th, to examine into the physical qualifications of the graduates and of the candidates for admission to the Academy. S. O. 116, A. G. O., May 29, 1878.

CRONKHITE, H. M., Capt. and Asst. Surgeon. Granted leave of absence for two months. S. O. 112, A. G. O., May 24, 1878.

YEOMANS, A. A., Capt. and Asst. Surgeon. Upon abandonment of Fort Richardson, to move with detachment of 10th Infy. to Fort Griffin, Tex., and there take post. S. O. 106, Dept. of Texas, May 21, 1878.

Medical Items and News.

CONTAGIOUS DISEASES — WEEKLY STATEMENT.—Comparative statement of cases of Contagious Diseases reported to the Sanitary Bureau, Health Department, for the two weeks ending June 1, 1878.

Week Ending	Typhus Fever.	Typhoid Fever.	Scarlet Fever.	Cerebro-spinal Meningitis.	Measles.	Diphtheria.	Small-pox.

THE HEALTH BOARD AND THE NUISANCES.—At a special meeting of the Medical Society of the County of New York, Prof. C. F. Chandler, the President of the Health Board, made a long statement of the work accomplished by said Board, in which it appeared that there was a saving of 5,000 lives and a prevention of 130,000 cases of serious illness per year. He claimed that all the nuisances for which the Board had been indicted were either removed or in process of removal.

MAINE MEDICAL ASSOCIATION.—The twenty-sixth annual meeting of the Maine Medical Association will be held in Portland, Maine, Tuesday, Wednesday, and Thursday, June 11, 12, and 13, 1878, commencing at 10 30 A.M.

THE NEW HAMPSHIRE MEDICAL SOCIETY.—The eighty-eighth annual meeting of this society will be held at Concord, Tuesday and Wednesday, June 18th and 19th, at 11 A.M.

AMERICAN MEDICAL ASSOCIATION.—Our report of the meeting of the American Medical Association could not be prepared in time for the present issue, but it will appear in the next.

NOW READY.—Nos. 1, 2, 3, 4 & 5.

STUDIES IN PATHOLOGICAL ANATOMY.

By FRANCIS DELAFIELD, M.D.,

Adjunct Professor of Pathology and Practice of Medicine in the College of Physicians and Surgeons; Visiting Physician and Pathologist of the Roosevelt Hospital; Visiting Physician and Curator of Bellevue Hospital.

IN ROYAL OCTAVO PARTS,

Each containing from two to four full-page Lithographic Plates in tint, and in color, with accompanying explanatory text. These studies will form, when completed, a treatise on Pathological Anatomy of exceptional value, especially for the remarkable fidelity of the illustrations, their minute and elaborate detail. The Parts will be published regularly, the first of each month, and sent to subscribers carefully rolled to protect the Plates from injury.

No. 5 contains—INFLAMMATION OF THE PLEURA.

PLATE ½ XVI. Endothelial Cells in Hydrothorax. Magnified 750 diameters.

PLATE XVII. Chronic Pleurisy with Adhesions.

PLATE XVIII. Vertical Section of the Pleura. Tubercular Pleurisy. Magnified 90 diameters.

Subscription Price, $5.00 a Year. *Single Numbers, 50 Cents.*

INVARIABLY IN ADVANCE.

SPECIMEN COPIES WILL BE SENT ON RECEIPT OF 50 CENTS.

Address the Publishers,

WILLIAM WOOD & CO., 27 Great Jones Street, New York.

K. & M.

GRANULATED EFFERVESCENT

PEPSIN, BISMUTH, AND STRYCHNIA.

ORIGINATED BY KEASBEY & MATTISON.

We again offer this preparation confidently to the profession. It has for four years enjoyed an extensive prescription among the most eminent of our practitioners. Its use has been attended with the most marked success perhaps of any of the various remedies recommended in dyspepsia, gastralgia, and kindred disorders. Its association with Carbonic Acid renders it palatable, and causes it to be retained by the most sensitive stomach. It is the only soluble form in which Pepsin and Bismuth should be ever given together, and is FIVE TIMES THE PEPSIN STRENGTH of the various elixirs, wines, liquors, etc., of the market. In reference to its reliability, we refer to the most prominent physicians in all sections of this country, who will very generally be found to be using it in their practice.

Always prescribe the GRANULATED EFFERVESCENT form, and always specify the "K. & M." preparation.

Each drachm or heaping teaspoonful contains FIVE GRAINS Saccharated Pepsin, two grains soluble Citrate of Bismuth, and one-fiftieth grain Citrate of Strychnia.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 21, 1877.

Gentlemen.—I have used a large number of your preparations for several years past with great satisfaction, and am happy to commend them to others from what I know both of your drugs and of yourselves. Very truly yours, W. W. KERN, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE CAFFEINE.

ORIGINATED BY KEASBEY & MATTISON.

The recent extensive employment of this salt as a remedy, amounting almost to a specific in cases of sick headache, and its use in nervous diseases generally, have caused us to place it upon our list. Its value is much enhanced by its administration with Carbonic Acid, so agreeably and efficiently produced by this form.

A heaping teaspoonful, containing ONE GRAIN of Citrate of Caffeine, should be given in a sick headache, every hour or two before and during the paroxysms.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 27, 1877.

Gentlemen—It gives me pleasure to add my testimony in regard to your preparations, which I have used for a long time; they are thoroughly reliable. Truly yours, THOMAS G. MORTON, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE LITHIA.

In the effervescent form this chemical is administered in a peculiarly advantageous manner. Its association with Carbonic Acid renders it much less liable to disturb the stomach, while in strength it is greatly superior to Lithia Water. A valued diuretic and lithontriptic, its importance in the treatment of rheumatic, gouty, and analogous disorders can scarcely be over-estimated.

We have doubled the strength of this preparation, each drachm or heaping teaspoonful containing FOUR GRAINS of the chemically pure salt.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 25, 1877.

Gentlemen—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, M.D., *Secretary American Medical Association.*

QUINETUM PILLS

(Sugar-Coated.)

The name **Quinetum** was given by Dr. De Vry to the collective alkaloids obtained from Peruvian bark; it has been extensively used by physicians throughout Holland in cases where the salts of quinine had been habitually employed. Dr. H. J. Vinkhuysen, Physician to the Household of the King of the Netherlands, has closely observed its effects, and arrived at the following conclusions:

1. The action of Quinetum in cases of marked or larval malaria, and especially in rheumatic affections due to malarious influences, is incomparably greater than that of quinine.

2. The tonic action of Quinetum is similar to, and even greater than that of quinine.

3. The influence of Quinetum in chronic cases is greater than that of quinine.

4. Persons who are liable to suffer from the toxic effects of quinine, and who therefore cannot take it without the greatest discomfort, can take Quinetum without this unpleasant effect, and yet obtain a similar therapeutical result.

5. Quinetum never causes noises in the ears.

6. Quinetum does not produce the unpleasant and even dangerous symptoms of quinine when given during the fit, and may be taken during the fit without causing any unpleasant feeling.

7. In all forms of pure malarial intermittent fever, Quinetum has the same apyretic effect as quinine, but is less powerful and acts more slowly. It must therefore be given in large doses, and at longer intervals before the ague fit, than quinine.

8. The only malarious disease in which Quinetum cannot be employed in place of quinine, is in pernicious fever. Quinetum requires more time to act than quinine, and as rapidity of action is absolutely necessary in this disease, Quinetum cannot be used in it as a substitute for quinine.

These Pills may be obtained of Druggists, or will be sent by mail, post-paid, on receipt of price.

LONDON M'F'G CO.'S
ESSENCES OF MEATS.

For Invalids, Travelers, and Persons of Delicate Health.

ESSENCE OF BEEF,
ESSENCE OF MUTTON,
ESSENCE OF CHICKEN.

These Essences consist solely of the juices of the Finest Meats, extracted by a gentle heat, without the addition of water or any substance whatever. They contain, therefore, the most stimulating and exhilarating portions of Meats, calculated to invigorate the heart and brain **immediately;** being without any gelatinous injurious elements, which require solution.

They are very effective in cases of **Sea Sickness.** Persons contemplating a sea voyage, or water travel of any kind, will find the Essences invaluable as a nourishing and stimulating preparation. They will be retained by the stomach in very critical cases of illness, when the most carefully prepared soup is rejected. They are also used with very satisfactory results in **Children's** complaints. Our Essences are heavy liquids, and, when placed upon ice, take a jellified form, retaining the fine flavors of the meats, thus making them very refreshing and pleasant to the taste.

Taken Direct from the Can without any Preparation whatever.

USE A DRY SPOON AND LEAVE THE CAN PARTLY OPEN. WILL KEEP IN ANY CLIMATE.

FOR SALE BY ALL DRUGGISTS.

PREPARED ONLY BY THE

London Manufacturing Company,

77 and 79 Varick Street, NEW YORK.

NEW HYPODERMIC SYRINGES.

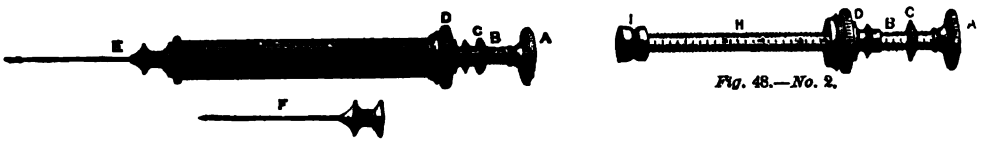

Fig. 48.—No. 2.

These cuts (two-thirds the actual size) represent a New Hypodermic Syringe of our Manufacture. With the exception of the needles, it is of German Silver, a material chosen as possessing, next to steel, the greatest rigidity and durability, while free from liability to oxydation. The barrel is formed by a process peculiar to ourselves, securing uniformity of calibre without soldered joint or seam. It is plated inside and outside with nickel. The piston is packed in the double parachute form, with leather prepared expressly for the purpose. It will be found to retain its elasticity, to operate smoothly, to resist all tendency of fluid to pass above, as of air below it. A nicely-engraved scale upon the piston-rod indicates minims, thirty being the capacity of the syringe.

Syringes Nos. 2, 3, and 4 have also a screw thread upon the piston-rod, and a traverse nut, thereby favoring the utmost nicety in the graduation of doses.

No. 3, Compact, has hollow piston-rod to receive one needle, also a protecting cover and fluid retainer; it may be carried in the Pocket Instrument or Vial Case, or without any case.

No. 4, Compact, is like No. 3, with the addition of a second needle, carried upon the syringe in the usual place, protected by a metal shield.

Nos. 1 and 2 are put up in neat morocco-covered case, with vial.

Two sizes of needles are furnished with each instrument, Nos. 1, 2, and 4; one only with No. 3. They are of refined steel, carefully tempered, and thoroughly plated with gold; they are of small diameter and large relative calibre, sharpened to such an angle as will offer least resistance to penetration, and therefore cause least pain. At the point of union with the socket they are reinforced with an outer covering of German silver, thereby overcoming the tendency to become broken at this place. They are connected with the barrels by a screw thread.

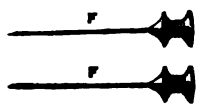
Prices: No. 1, **$4.00.** No. 2, **$4.50.** Postage, .03.
" No. 3, **3.00.** No. 4, **4.00.** " .02.

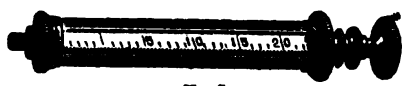
No. 3.

These Syringes are so thoroughly and strongly made as to be free from the annoying accidents common to most Hypodermic Syringes; and we believe that for convenience, durability, and nicety of construction, they have no superior.

OTHER HYPODERMIC SYRINGES.

No. 7, glass-barrel, graduation engraved on barrel, with screw nut on piston, nickel-plated mountings, two best steel gilt needles, in neat case, ... **$3.00** *Postage.* .02

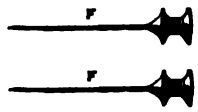




No. 9.

Postage.

No. 9, glass, graduation engraved and numbered on piston-rod, with screw nut, two best steel gilt needles, in neat case, **$3.00** .02
No. 7 or No. 9, with two steel unplated needles, either, ... **2.50** .02
No. 10, glass, Luer's (French), graduation as No. 9, one gold needle and two steel needles, silver mountings, neat velvet-lined morocco case, ... **12.00** .02
No. 11, glass cylinder, fenestrated, nickel-plated metal mounting (see cut).



No. 11.

As represented in the cut, the glass cylinder is encased in a metal mounting, fenestrated to show the graduations for minims. The instrument may readily be taken apart for cleaning, and, for those who prefer glass, is recommended for its non-liability to breakage. Price, with two best steel gilt needles, in a neat case, ... **$3.50** *Postage.* .02

☞ *Any of the above will be sent by return mail on receipt of price and postage.*

HYPODERMIC SYRINGES OF ALL KINDS PROMPTLY REPAIRED.

Our new **Illustrated Catalogue of Surgical Instruments,** also a new Pamphlet on Inhalation of Atomized Liquids, by distinguished medical authority, with many valuable formulas, will be forwarded, postpaid, on application.

TO THE MEDICAL PROFESSION.

MALTINE.

(EXTRACT OF MALTED BARLEY, WHEAT AND OATS.)

THIS PREPARATION CONTAINS FROM THREE TO FIVE TIMES THE MEDICINAL AND NUTRITIVE ELEMENTS FOUND IN EXTRACT OF MALT.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat* and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST: In the manufacture of ***MALTINE*** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates and Albuminoids on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity possessing little virtue aside from the saccharine matter which it contains.

SECOND: *Carbon, Hydrogen, Nitrogen, Phosphorus, Sulphur, Iron, Magnesium* and *Potassium* are essential elements in the food of man; and it is only in ***MALTINE,*** containing the combined properties of malted *Barley*, *Wheat* and *Oats* that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD: *Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. ***MALTINE*** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH: LIEBIG says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley in the manufacture of ***MALTINE*** is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of ***MALTINE,*** *and would request a trial and comparison of merits with any article offered for similar uses.*

MALTINE AND ITS COMPOUNDS

Can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, Imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULAS AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS AND ON THE LABEL ATTACHED TO EACH BOTTLE:

***MALTINE* WITH HOPS.**

***MALTINE,* FERRATED:**
This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

***MALTINE* WITH PHOS. IRON AND QUINIA:**
A powerful general and nutritive tonic.

***MALTINE* WITH PHOS. IRON, QUINIA AND STRYCHNIA:**
A powerful nutritive, general and nervous tonic.

***MALTINE* WITH HYPOPHOSPHITES:**
This preparation is specially indicated in Phthisis, Rickets and deficient Ossification.

***MALTINE* WITH PEPSIN AND PANCREATINE:**
One of the most effective combinations in Dyspepsia, Cholera Infantum and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the ***MALTINE.*** We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

***MALTINE* WITH BEEF AND IRON:**
One of the most valuable combinations in cases of general Debility, when there is deficient nutrition and a deficiency of Iron in the system.

***MALTINE* WITH COD LIVER OIL:**
The most perfect emulsion, and most agreeable and effective mode of administering this nauseous but valuable Oil yet discovered.

***MALTINE* WITH COD LIVER OIL AND PHOSPHORUS:**
In this combination the Phosphorus has no irritant effect upon the stomach.

***MALTINE* WITH COD LIVER OIL AND IODIDE OF IRON:**
This is prepared with the tasteless Iodide of Iron, which undergoes no chemical change from contact with the Oil, and does not blacken the teeth.

***MALTINE* WITH ALTERATIVES:**
In this preparation ***MALTINE*** is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.
Each fluid ounce contains: *Chloride Calcium*, 10 grains; *Chloride Magnesium*, 10 grains; *Bromide Sodium*, 5 grains; *Iodide Potassium*, 1 grain; *Iodide Iron*, ¼ grain. DOSE, One teaspoonful to one tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only*.

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in amber bottles holding sixteen fluid ounces; each bottle inclosed in a folding paper box.

WYETH'S DIALYSED IRON.

(FERRUM DIALYSATUM.)

A Pure Neutral Solution of Peroxide of Iron in the Colloid Form. The Result of Endosmosis and Diffusion with Distilled Water.

PREPARED SOLELY BY

JOHN WYETH & BRO.,

PHILADELPHIA.

This article possesses great advantages over every other ferruginous preparation heretofore introduced, as it is a solution of Iron in as nearly as possible the form in which it exists in the blood. It is a preparation of invariable strength and purity, obtained by a process of dialysation, the Iron being separated from its combinations by endosmosis, according to the law of diffusion of liquids. It has no styptic taste, does not blacken the teeth, disturb the stomach, or constipate the bowels.

It affords, therefore, the *very best* mode of administering **IRON** in cases where the use of this remedy is indicated.

The advantages claimed for this form of Iron, are due to the absence of free acid, which is dependent upon the perfect dialysation of the solution. The samples of German, French, and American Liquor Ferri Oxidi Dialys., which we have examined, give acid reaction to test paper. If the dialysation is continued sufficiently long, it should be tasteless and neutral.

Our Dialysed Iron is not a saline compound, and is easily distinguished from Salts of Iron by not giving rise to a blood-red color on the addition of an Alkaline Sulpho-Cyanide, or a blue precipitate with Ferro-Cyanide of Potassium. It does not become cloudy when boiled. When agitated with one part of Alcohol and two parts of Ether (Fortior), the Ether layer is not made yellow.

Physicians and Apothecaries will appreciate how important is the fact that, as an antidote for poisoning by Arsenic, Dialysed Iron is quite as efficient as the Hydrated Sesquioxide (hitherto known as the best remedy in such cases), and has the great advantage of being always ready for immediate use. It will now doubtless be found in every drug store to supply such an emergency.

FULL DIRECTIONS ACCOMPANY EACH BOTTLE.

Physicians will find our DIALYSED IRON in all the leading drug stores in the United States and Canada.

It is put up in bottles retailing for ONE DOLLAR, containing sufficient for four months' treatment. Large size is intended for hospitals and dispensing. Retail at $1.50. Price Lists, etc., etc., sent on application.

JOHN WYETH & BRO.

WYETH'S COMPRESSED TABLETS
OF
CHLORATE OF POTASH.

For Hoarseness, Bronchial Irritation, Sore Throat, Diphtheria, Croup, etc., etc.

Chlorate of Potash is a remedy of acknowledged value in cases of Diphtheritic Sore Throat, and in Inflammation of the Mouth and Throat, induced by a depressed state of the system. In these instances, as in the milder forms of Croup, it has, besides its depurative and detergent effects, a solvent action on the deposits, characteristic of those troublesome and dangerous affections. It relieves Hoarseness; and in many cases of Fetid Breath from disordered secretions, it proves an efficient corrective. Its virtues in simple Angina, or ordinary Sore Throat, are recognised by many of the most eminent physicians.

As the taste of this article is not disagreeable, we have prepared it in the form of Compressed Tablets, thus giving the patient the full benefit of its action, undiluted with Sugar, Gum, or other vehicles, which would not only prevent its effects, but which sometimes themselves offend the stomach.

The Lozenges usually contain about twenty-five (25) grains of gum and sugar, with two grains of the Chlorate of Potash, while each of these Tablets contains simply five grains of the Chlorate, all of which, dissolved in the saliva, acts on the affected mucous membranes.

If allowed to dissolve in the mouth, the topical effect is much more efficient than a saturated solution, as while the solution is but temporary, the tablet really acts as a continuous gargle.

FOR SORE THROAT, HOARSENESS.

DIRECTIONS.—Adults should take one every hour or two until relieved, allowing it to dissolve slowly in the mouth. Children, half of one as often.

For Offensive Breath, no remedy will give more certain relief; use one, two or three times a day.

For Diphtheria, Croup, and the more serious ailments, the physician should direct.

PEPTONIC PILLS.

Pepsin, Pancreatin with Lacto-Phosphate of Lime and Lactic Acid.

(COPYRIGHT SECURED.)

This pill will give immediate relief in many forms of Dyspepsia and Indigestion, and will prove of permanent benefit in all cases of enfeebled digestion, produced from want of proper secretion of the Gastric Juice. By supplementing the action of the stomach, and rendering the food capable of assimilation, they enable the organ to recover its healthy tone, and thus permanent relief is afforded. One great advantage of the mode of preparation of these pills is the absence of sugar, which is present in all the ordinary Pepsin and Pancreatin compounds. In this form, the dose is much smaller, more pleasant to take, and is less apt to offend the already weak and irritable stomach. The results of their use have been so abundantly satisfactory, that we are confident, further trial will secure for them the cordial approval of the Medical Profession and the favor of the general public.

Each pill contains one grain of pure PEPSIN, and one of pure PANCREATIN, which is equivalent to 10 grains of the ordinary or Saccharated usually prescribed and dispensed. Physicians will appreciate the great advantage of this mode of administration. The increased benefit to the dyspeptic, being due to a full and effective dose of each, freed from the unnecessary bulk, and really hurtful addition of sugar. A single pill will give immediate relief.

DIRECTIONS.—Take one pill immediately after eating or when suffering from Indigestion, Lump in the Throat or Flatulence. For children, reduce the pill to powder and give one-fourth or half, according to age.

COSMOLINE

[Unguentum Petrolei]

Sample Furnished on application.

The Post-Office Laws forbid anything of an oleaginous nature being sent through the mails.

THEOPHILUS REDWOOD, Ph.D., F.C.S., Professor of Chemistry and Pharmacy to the Pharmaceutical Society of Great Britain, says in reference to this preparation:—

"UNGUENTUM PETROLEI appears to be obtained from crude Petroleum by fractional distillation and subsequent purification. Products of a similar description have been in roduced in pharmacy, and recommended as substitutes for animal or vegetable fats in the preparation of ointments or liniments.

"Among these, the UNGUENTUM PETROLEI is distinguished by its having a firmer consistence and a higher melting point, and in these respects it resembles pure lard, from which it differs in that it is entirely free from liability to become rancid or to undergo any chemical change. It has an amber color and a smooth, jelly-like appearance, and is almost wholly free from odour or taste. It is free from, and insoluble in water. It is very slightly soluble in rectified spirit, but very soluble in ether, in fixed oils and fats. I am of opinion that its characters and properties are such as to render it a valuable adjunct to our *Materia Medica*."

Dr. TILBURY FOX, [London,] writes:—"I like the UNGUENTUM PETROLEI very much indeed, and shall not fail to prescribe it."

THE LANCET ANALYTICAL REPORT ON UNGUENTUM PETROLEI.

From the LANCET, London. October 20th, 1877.—UNGUENTUM PETROLEI.—Simi-transparent, pale yellow in colour, and perfectly free from offensive smell. We consider it a valuable preparation, and hope its use will become as common in England as it is said to be in America."

From the MEDICAL TIMES AND GAZETTE, London, October 20th, 1877.—"The substance introduced under the name of UNGUENTUM PETROLEI is of about the consistence of good lard, has no smell, keeps any length of time, apparently, without becoming rancid, and may be exposed to any kind of atmosphere without undergoing chemical change. It has long been, we understand, in use in America, where it enjoys a wide-spread popularity; and it will, we doubt not, come into extensive use here also as a vehicle for making ointments, as a demulcent in various diseases of the skin, and as a lubricant."

Prepared by E. F. HOUGHTON & CO., 211 South Front St., Philadelphia.

Sole Manufacturers of

Dr. Byrne's Perfected Galvanic Battery for Electro-Cautery

The only apparatus of the kind for which a special award was granted at the Centennial Exhibition in accordance with the Reports of Sir William Thomson and Professor Henry, based upon actual experiments.

It embraces the very latest and best improvements, and is by far **the most complete and powerful instrument yet devised for galvano-cautery operations.** It consists of 4 cells in a neat case 8½ x 7¼ x 4½. **Its heating capacity is fifteen inches of No. 21 Platinum wire, or twenty inches of No. 18,** and it will maintain a current available for surgery during half an hour without change of fluid.

The weight of the entire battery is ten pounds. It is, therefore, conveniently portable and **the most efficient and reliable battery for galvano cautery yet offered to the profession.** Its distinctive peculiarity consists in the negative plates by which much greater power is obtainable than from carbon or Platinum, while they are equally indestructible with the latter. **These plates (patented) are also specially adapted for all battery organizations requiring great quantity and a high electro-motive force,** as for Electro-Plating, Electro-Motor for Sewing Machines, discharging explosives, etc.

Trommer's Extract of Malt.

The rapidly increasing demand for our **IMPROVED EXTRACT OF MALT**, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantity; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or molding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made, is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The Extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops,** viz.: Malt Sugar, Dextrine, Diastase, Resin and Bitter of Hops, Phosphates of Lime and Magnesia, and Alkaline Salts.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:

Malt Sugar, 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712; Alkalies, .377; Water, 25.7. Total, 99.958.

In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article. Yours truly, SILAS H. DOUGLAS,

Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt, contains a larger quantity of the active properties of Malt, than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ lbs. of the Extract.

Our preparations of Malt are for sale by druggists generally throughout the United States and Canadas, at the following prices:

SIXTH EDITION—GREATLY ENLARGED.

A HANDBOOK OF THERAPEUTICS.

By SIDNEY RINGER, M.D., Prof. of Therapeutics in University College; Physician to University College Hospital.

In one 8vo volume, handsomely bound in extra muslin. Price $4.50.

"Upon the appearance of that now indispensable work, *Ringer's Handbook of Therapeutics*, my attention was particularly attracted to the frequency with which he recommends small doses of medicine that we have been accustomed to use in much larger doses for entirely different diseases. Some of these remedies were recommended so strongly, that I was induced to give them a trial, more especially as my practice among children compels me, for many reasons, to administer as little unpleasant-tasting medicines as possible. Their use with children first having been found satisfactory, my position in connection with the New York Dispensary afforded me the opportunity of further testing them in numerous cases of adults."—DR. DESNEAU *in Medical Record, July 28, 1877.*

"The author has selected everything of substantial value among the recent advances in Therapeutics. It is a practical work, replete with interesting and reliable information, and will be found to be one which can be consulted by the practitioner with much benefit. We would advise every young physician to procure and read the book. It fills all the author claims for it in letter and spirit, and is written in such a clear and simple style that all who read it will do so with pleasure."—*Western Lancet.*

"We can scarcely doubt that the present edition will be quickly sold."—*The Practitioner.*

"A very suggestive and useful work on Therapeutics."—*St. Louis Med. and Surg. Journal.*

Dr. N. Gerber's Milk-Food

Prepared in THUN, SWITZERLAND.

Many farinaceous foods prepared for children contain too much sugar and starch, while the milk added to these foods is insufficient in quantity, so that the proportion between the azote and non-azote bodies is not fairly balanced, and consequently, the children are fed in an irrational manner.

After long experimentation, in which I have sought to avoid this serious defect, I now offer an article which I believe will meet the necessity of the case, inasmuch as it contains **less starch and sugar and more milk.**

DIRECTIONS.

For children up to three months old, one part of the "Food" to eight or ten parts **cold water.** The quantity of water may be reduced for older children to four or five parts to one of "Food." After mixing well, boil it five minutes, taking care to stir it well.

CHEMICAL ANALYSES.

The composition of Dr. N. GERBER'S "Milk-Food" is stated by well-known Chemists, as follows:

THE ANALYTICAL SANITARY INSTITUTION,
LONDON, April 27, 1876.

The results of my analysis show that Dr. GERBER'S Milk-Food is composed in part of condensed milk; that it contains all the elements of a complete food, namely: the Starchy, Saccharine, Albuminous, and Mineral, in such proportions as render the food well adapted for the nutrition of infants and young children.

The amount of Nitrogenous matter and of Phosphoric Acid furnished are considerable.

The Nitrogenous matter includes 1.68 per cent of Nitrogen, and the Mineral matter 0.51 per cent of Phosphoric Acid.

ARTHUR HILL HASSALL, M.D., Chemist,
Author of "Food; its Adulterations, and the Method for their Detection."

MONTREAL, Canada, November 10, 1877.

I have satisfied myself that Dr. GERBER'S Milk-Food is not a mere "Farinaceous Food," but that it really contains, as it professes to contain, the formative elements of *Flesh, Blood and Bone*; also *Carbonaceous Matter* for the maintenance of animal heat,—thus constituting a *complete diet*, formed on the basis and type of Human Milk. * * * I can conceive of no better substitute for "Mother's Milk."

J. BAKER EDWARDS, Ph.D., D.C.L.,
Professor of Chemistry Bishop's College and College of Pharmacy, Montreal, and Public Analyst for District of Montreal, under Inland Revenue Act.

HYGIENIC PHYSIOLOGICAL INSTITUTE,
MUNICH, Sommer, 1877.

Repeated experiments of Dr. GERBER'S Milk-Food, made by D. Med. FR. RENK, Assistant of Privy Counsellor Prof. Dr. MAX VON PETTENKOFER, at his Laboratory; also, at Prof. Dr. C. VOIT'S Physiological Institute in Munich, show the average analysis to be:

Water,	4.31 per cent.
Mineral Salts,	2.03 "
Fats,	5 23 "
Albuminates,	15.51 "
Hydro-Carbons, soluble,	48.41 "
" " insoluble,	24.46 "
	99.95 "

This preparation is highly recommended by:

Prof. DEMME, Physician to the Jenner Hospital for Children Berne, Switzerland.

Dr. J. RUD. SCHNEIDER, Sup't of the Hospital of the Canton Berne, Switzerland.

A. M. SIGEL, M.D., Phys. to the Olgo Hospital Asy. for Infants, Stuttgart.

Dr. PIO MORI, Medico Primario, Phy. to Hospital for Children, Rome, Italy.

Dr. GRIFFINI, Director of the Foundlings' Home and Lying-in Hospital in Milan.

E. BOUCHUT, Professor of the Faculty of Medicine of Paris, and Phys. to the Sick Children's Hospital.

Prof. Dr. ZWEIFEL, in Erlangen.

ROETHLISBERGER & GERBER,
Sole Agents for the United States,
NEW YORK.

This soap is confidently offered to the medical profession and the public, as being a detergent, which, from the nature of its composition, possesses UNDOUBTED HEALING QUALITIES.

It is a preparation of useful VEGETABLE OILS AND REFINED PINE TAR SAPONIFIED, in combination with CHEMICALLY PURE GLYCERINE. We thus produce a detergent absolutely free from the valid objections frequently discoverable in soaps compounded from animal fats, which HAVE BEEN KNOWN to be POSITIVELY INJURIOUS TO THE SKIN.

This soap has already been used in many public institutions: as Nurseries, Infant Asylums, Hospitals, Dispensaries, etc., and abundant evidence, from them and from private physicians, can be given those desiring it, which will bear out all that is claimed for the remedial excellence of PACKER'S TAR SOAP.

In the treatment of

DISEASES OF THE SKIN,

this soap is of especial service: first, because while other soaps, if used, may and probably will exercise some injurious effect, this is the *least irritating of all* soaps; and second, because by virtue of its TAR and GLYCERINE, of which it contains a very large percentage.

SURGEONS find it the best soap for cleansing wounds, ulcers, etc., and for antiseptic and deodorizing purposes.

We feel the utmost confidence that the expectations of the physician will be uniformly realized, if a little pains is taken to designate PACKER'S in cases where TAR SOAP is indicated.

Recommend to the Profession and Trade especially

CARLSBADER SPRING WATER,

AND OTHER PRODUCTS OF THE SPRING.

According to our latest contracts with the proprietors of the different Carlsbad Spring, we get fresh shipments with every steamer, so as to be able to supply this water in a quality not to be had formerly. Carlsbad Water, and especially the

SPRUDEL,

SCHLOSS (Castle),

THERESIA,

MUEHL (Mill) SPRING,

Are to-day relied on by the Medical Profession in Germany, as the surest remedy in Diabetes, Diabetes Melitus, and Diseases of the Kidneys.

They are likewise used as a specific almost **for reducing Obesity.**

They are a mixed alkaline, saline water of reliable healing quality in Liver and Bowel Complaints, and Diseases of the Prostate Gland.

Sold, **ALWAYS FRESH,** only by us. For price and other information, please send for Pamphlet on Mineral Waters. Special Quotations on quantities.

Carlsbad Sprudel Salt may be used either to assist the effects of the Carlsbad Water or as a remedy by itself. In the latter case the dose is one or two teaspoonfuls, either in a dry state or dissolved in water.

It dissolves rapidly and completely in warm water, and in this form a curative effect may be expected with more certainty. It is advisable to use water at a temperature of 30° to 40° R. This, however, does not exclude its being taken with cold water. The best time for taking the salt is in the morning, shortly before breakfast, fasting.

CARLSBAD SPRUDEL SOAP, for Psoriasis, Eczema, and Chronic Dermatoses, always on hand.

CARLSBAD SPRUDEL LOZENGES, representing in a light degree the qualities of the water, always on hand, FRESH IMPORTED.

MY PREPARATION OF FLUID EXTRACT OF DAMIANA has now been before the profession for a term of about eighteen months. Its introduction has been retarded and injuriously affected from the fact, that several large houses in New York, not counting other concerns outside of it, have sold during all this time, so-called Damiana Extract, which is not made from the true plant, and that many physicians, who have heard favorable reports from my preparation have failed to obtain like results from other makes. I have therefore offered, and repeat it here, that I am willing to give or send (expressage unpaid) to any physician asking for it, a one ounce sample of this Fluid Extract for the sole purpose of showing at the first glance that my preparation is different from that of other makers. This is not intended to be sufficient for a physiological test, but simply as a specimen.

According to the reports, so far gathered by me, Fluid Extract of Damiana has a most decided *tonic action* on the urinary and uterine organs, and in its intensity of action, is superior to any other known remedy.

It acts with almost specific effect in *prostatitis and spermatorrhœa*. Cases of gleet that yielded to no other treatment have been cured by it. Cystitis has been very successfully treated with Damiana, and there is no drug equal to it in allaying weakness of the bladder and the frequent desire to urinate. In *nervous exhaustion* especially produced by brain labor and over work, it is superior to Quinine, and many patients who have habitually used the former derive greater and more lasting benefit from the Damiana. Several physicians have thought it incongruous that an aphrodisiac should be likewise a remedy for spermatorrhœa; but experience has shown that the tonic action of the drug is employed in curing the debility very much like the effect of morphia, which, when used where there is great pain, first subdues the pain before producing sleep, and if its powerful and lasting tonic action is considered, the effect of the Damiana as an aphrodisiac is physiologically explained. It has been given with very good effect by some of the best known Gynæcologists in *Dysmenorrhœa and Leucorrhœa* although no reports have been published as yet, and it appears to be of great value in atonic ovarian diseases.

NITRITE OF AMYL PEARLS,

of 2, 3, 5, 8 and 10 drops, exactly dosed, *warranted not to burst*, made according to a new process, and largely use in *sea sickness*.

WARBURG'S TINCTURE,

pronounced by all the members of the profession as the most reliable made, and used in all cases of *Malaria, Intermittent Fevers, Ague*, and the complications arising from such cases where Quinia does not act.

1 oz. Bottles, $5 per doz., or $5 per lb.

IODOFORM CRAYONS, for ulceration of the cervix.
ERGOT CRAYONS, for uterine diseases, $1 per doz.
POWDERS OR PILLS, made by compression.
SUPPOSITORIES, made cold by compression.
BOUGIES of Tanin, Sulphate of Zinc, or any combinations made cold by compression, while the *patient waits*.

Clinical Professor of Surgery.

THE COLLEGIATE YEAR is divided into three Sessions: A Preliminary Session, a Regular Winter Session, and a Spring Session.

THE PRELIMINARY SESSION will commence September 18, 1878, and will continue until the opening of the Regular Winter Session. It will be conducted on the plan of that Session.

THE REGULAR WINTER SESSION will commence on the Second of October, 1878, and end about the 1st of March, 1879.

The location of the new College edifice being immediately opposite the gate of Bellevue Hospital, and a few steps from the ferry to Charity Hospital, Blackwell's Island, the Students of the University Medical College are enabled to enjoy the advantages afforded by these Hospitals, with the least possible loss of time. The Professors of the practical Chairs are connected with the Hospitals, and the University Students are admitted to *all the Clinics* given therein, *free of charge.*

In addition to the daily Hospital Clinics, there are eight Clinics each week in the College building. Five Didactic Lectures will be given daily in the College building, and Evening Recitations will be conducted by the Professors of Chemistry, Practice, Anatomy, Materia Medica, &c., Physiology, Surgery and Obstetrics, upon the subjects of their Lectures.

THE SPRING SESSION embraces a period of twelve weeks, beginning in the first week of March and ending the last week of May. The daily Clinics, Recitations and Special Practical Courses will be the same as in the Winter Session, and there will be Lectures on Special Subjects by the Members of the Post-Graduate Faculty.

THE DISSECTING ROOM is open throughout the entire Collegiate year; material is abundant, and it is furnished free of charge.

STUDENTS WHO HAVE STUDIED TWO YEARS may be admitted to examination in Chemistry, Anatomy and Physiology, and if successful, will be examined at the expiration of their full course of study, on Practice, Materia Medica and Therapeutics, Surgery and Obstetrics; but those who prefer it may have all their examinations at the close of their full term.

FEES.

For Course of Lectures	$140 00
Matriculation	5 00
Practical Anatomy Fee, including material for dissection	10 00
Graduation Fee	30 00
Post-Graduate Certificate	30 00

For further particulars and circulars, address the Dean,

Prof. CHAS. INSLEE PARDEE, M.D.,

University Medical College, 410 East 26th St., New York City.

DETROIT MEDICAL COLLEGE.

SESSIONS OF 1878-79.

FACULTY.

PRELIMINARY AND REGULAR SESSIONS.

EDWARD W. JENKS, M.D., President,
Professor of Medical and Surgical Diseases of Women, and Obstetrics.

GEORGE P. ANDREWS, M.D.,
Professor of Principles and Practice of Medicine and Clinical Medicine.

ALBERT B. LYONS, M.D.,
Professor of Chemistry and Toxicology.

THEODORE A. McGRAW, M.D., Treasurer,
Professor of Principles and Practice of Surgery and Clinical Surgery.

C. B. GILBERT, M.D.,
Professor of Materia Medica, Therapeutics, and Clinical Diseases of Children.

N. W. WEBBER, M.D.,
Professor of General and Descriptive Anatomy and Clinical Surgery.

LEARTUS CONNOR, M.D., Secretary
Professor of Physiology and Lecturer on Diseases of the Eye and Ear.

RECITATION SESSION.

H. O. WALKER, M.D.,
Lecturer on Genito-Urinary System and Rectum.

DANIEL LA FERTE, M.D.,
Demonstrator of Anatomy and Lecturer on Orthopedic Surgery and Tumors.

J. G. JOHNSON, M.D.,
Lecturer on Diseases of Mind and Nervous System.

J. H. CARSTENS, M.D.,
Lecturer on Differential Diagnosis.

E. L. SHURLY, M.D.,
Lecturer on Diseases of Throat and Lungs.

F. A. SPALDING, M.D.,
Lecturer on Diseases of Skin.

C. C. YEMANS, M.D.,
Lecturer on Chemistry.

JAS. D. MUNSON, M.D.,
Demonstrator of Practical Physiology.

E. A. CHAPOTON, M.D.,
Demonstrator of Practical Microscopy.

The Collegiate Year is divided into three sessions.

PRELIMINARY SESSION opens Wednesday, September 4th, 1878, and continues one month. The Clinics are held and the Lectures delivered by the Professors of the regular Faculty, and in the same order and frequency as during the Winter Term. Opportunity is given to dissect or work in the Chemical and Physiological Laboratories.

THE REGULAR SESSION opens Wednesday, October 2d, 1878, and continues five months. During this term all the branches of *General Medicine* and *Surgery*, both scientific and practical, are taught with care and thoroughness. All students are daily examined on the subjects of the lectures and on their dissecting and laboratory work.

Senior students have *daily practice* in the *art of examining patients*, in forming their own diagnosis, prognosis and treatment. As this is done under the direction of the professor holding each clinic, and in the presence of the class, it constitutes an invaluable course of training.

THE RECITATION SESSION begins second Wednesday in March, 1879, and continues four months. Daily during this term there will be held a lecture, recitation and one or two clinics. The lectures will be upon special subjects of medical or surgical interest.

The recitations will embrace the general subjects of the Regular Session, viz., Anatomy, Surgery, Midwifery, Diseases of Women, Physiology, Practice of Medicine, Materia Medica and Chemistry.

Though the Recitation and Preliminary Sessions are optional, it is hoped that all who can, will avail themselves of their manifest advantages in supplementing the regular winter course.

Three Hospitals—Harper's, St. Mary's and St. Luke's—with two large free dispensaries, afford an abundance of clinical material for illustrative and practical teaching.

All lectures are delivered on Hospital grounds. The *peculiar feature* of this school is the *intimate union* between its *laboratory*, *clinical* and *didactic* instruction.

FEES

FOR PRELIMINARY AND REGULAR SESSIONS:

Matriculation	**$ 5 00**
Hospital Fees	**10 00**
Lecture Fees	**40 00**
Graduation	**25 00**
Lecture Fees to third course students	**25 00**

For the Recitation Term the Lecture Fees are $10, to those who attend the other courses. All others are required to matriculate and take out the Hospital tickets.

All fees payable in advance to the *Secretary*.

Board and Rooms can be obtained at low rates—according to accommodations—from $3 to $5 per week. Announcement and Catalogue, or any further information which may be desired, can be promptly obtained by addressing

LEARTUS CONNOR, M.D., Secretary,
92 CASS STREET, DETROIT.

BELLEVUE HOSPITAL
MEDICAL COLLEGE,

CITY OF NEW YORK.

MEMBER OF THE AMERICAN MEDICAL COLLEGE ASSOCIATION.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878-1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures upon special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and ords as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DORSMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consist chiefly of Recitations from Text-Books. This term continues from the first of March until the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the Faculty. Regular clinics are also given in the Hospital and in the College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

JEFFERSON MEDICAL COLLEGE,

PHILADELPHIA.

The Fifty-fourth Session of the Jefferson Medical College will begin on Tuesday, 1st October, 1878, and will continue until 1st of March, 1879. PRELIMINARY LECTURES will be held from Monday, 2d September.

PROFESSORS.

JOSEPH PANCOAST, M.D., General, Descriptive, and Surgical Anatomy *(Emeritus)*.
SAMUEL D. GROSS, M.D., LL.D., D.C.L., Oxon. Institutes and Practice of Surgery.
ELLERSLIE WALLACE, M.D., Obstetrics and Diseases of Women and Children.
JOHN B. BIDDLE, M.D., Materia Medica and General Therapeutics.
J. AITKEN MEIGS, M.D., Institutes of Medicine and Medical Jurisprudence.
J. M. DA COSTA, M.D., Practice of Medicine.
WILLIAM H. PANCOAST, M.D., General, Descriptive, and Surgical Anatomy.
ROBERT E. ROGERS, M.D., Medical Chemistry and Toxicology.

SPECIAL COURSES ARE ALSO GIVEN ON THE FOLLOWING SUBJECTS:

DERMATOLOGY and **SYPHILITIC DISEASES**, by Dr. F. F. MAURY, one of the Surgeons to the Philadelphia Hospital.

PATHOLOGICAL ANATOMY, by Dr. M. LONSTRETH, Pathologist to the Pennsylvania Hospital, with practical illustration by autopsies, to sections of the class of convenient size.

OPERATIVE SURGERY, with operations on the Cadaver, by Dr. JOHN H. BRINTON, one of the Surgeons to the Philadelphia Hospital.

OPHTHALMOLOGY is treated both clinically and didactically during the entire course, by Dr. WILLIAM THOMSON, one of the Surgeons to the Wills Ophthalmic Hospital.

LARYNGOSCOPY, with DISEASES OF THE THROAT, by Dr. J. SOLIS-COHEN.

DISEASES OF THE URINO-GENITAL ORGANS, by S. W. GROSS, M.D.

THE DEMONSTRATOR OF SURGERY, Dr. J. EWING MEARS, delivers a distinct course of Demonstrations of Surgery, with illustrations on the Cadaver, during the entire Session.

PRACTICAL CHEMISTRY, with *Qualitative* and *Quantitative Analysis*, the *Examination of Normal and Abnormal Products*, and *Manipulations* by the Student himself, is taught by the Professor of Chemistry, assisted by the Demonstrator.

EXPERIMENTAL PHYSIOLOGY. By Dr. H. C. CHAPMAN, Demonstrator.

THE USE OF THE MICROSCOPE. By Dr. J. GIBBONS HUNT, Demonstrator.

PRACTICAL ANATOMY AND MORBID ANATOMY. For the study of Practical Anatomy, a full supply of material is furnished *free of charge*. The Anatomical Rooms are spacious and provided with every convenience, and not only are subjects for dissection to be had without expense, but there are no incidental or extra charges of any kind.

CLINICAL INSTRUCTION is given daily at the College Hospital. The SURGICAL CLINIC is held on Wednesdays and Saturdays, by Professors GROSS, JOSEPH PANCOAST, and W. H. PANCOAST. The MEDICAL CLINIC, on Mondays and Thursdays, by Profs. DA COSTA, BIDDLE, and MEIGS. The CLINIC of Diseases of Women and Children, on Tuesdays, by Prof. WALLACE. The CLINIC of Diseases of the Eye, on Fridays, by D. THOMSON. The PENNSYLVANIA HOSPITAL is near the College, and the corps of lecturers includes Profs. DA COSTA, and MEIGS. Prof. PANCOAST and Drs. MAURY, BRINTON, and S. W. GROSS are connected with the staff of the PHILADELPHIA HOSPITAL.

THE NEW HOSPITAL OF THE JEFFERSON MEDICAL COLLEGE was begun in November, 1875, and is now in operation. It is situated immediately west of the College, bounded on three sides by streets and a wide space on the fourth side, and will afford accommodation for at least one hundred beds. It is constructed according to the most approved principles of hospital architecture and is furnished with every necessary appliance for heating, ventilation, etc. A spacious amphitheatre, seating more than 600 students, is provided for Clinical Lectures, which, with daily visits to the wards, form part of the regular services of the College.

FEES.

For a Full Course,	$140
Matriculation Fee (paid once only),	5
Graduation Fee,	30

Students who have attended two Courses on Anatomy, Materia Medica, Chemistry, or Institutes, may be examined on any of these branches at the end of the second year.

A SUMMER COURSE of Supplementary Lectures is given, beginning 17th March, 1879, and extending through the months of April, May, and June. There is no additional charge for this Course to Matriculates of the College except a registration fee of five dollars.

The Annual Announcement will be sent on application to

J. B. BIDDLE, M.D., Dean.

WM. WOOD & CO., Publishers and Dealers in Medical Books,
27 Great Jones Street, New York.

CHAMPION SPOUTING SPRING NATURAL WATER FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*
Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Cars.*
Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.**, or to the Company's office, **205-213 E. 12th St., New York**, will receive prompt attention.

Instruction, Retreats, Private Hospitals, &c., &c.

TO ADVERTISERS.—Cards inserted, under the above headings, at the rate of 20 cents per line, column width, Nonpareil type. *No Advertisements taken for less than Ten Lines.*

Offers to parents and guardians, superior facilities for the improvement of this class of persons, and the comforts of an elegant country home. A few cases of *Insanity*, of mild type, have always been received.
GEO. B. BROWN, M.D., *Superintendent.*

NEW YORK, JUNE 4, 1878.

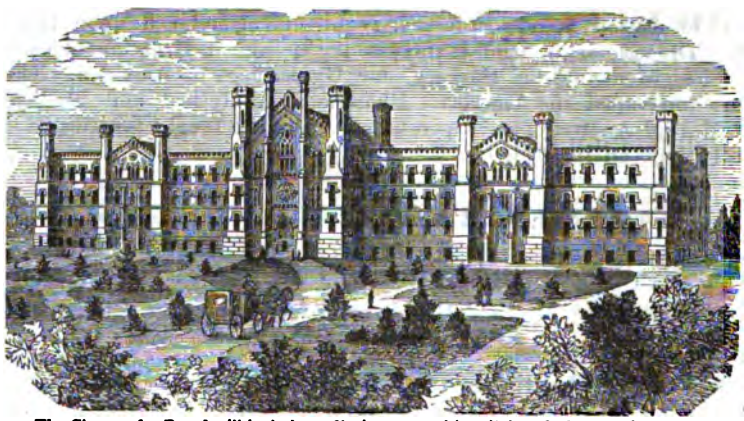
AN EXAMINATION of candidates for the position of Assistant to the House Surgeon at St. Luke's Hospital will be held on June 25th, at the Hospital. Candidates are requested to apply on or before June 18th, to Dr. Geo. A. Peters at No. 12 West 29th Street.

This Examination will be strictly competitive.

CHAS. McBURNEY, MD., *Secretary of the Medical Board.*

NEW YORK STATE INEBRIATE ASYLUM,

Binghamton, Broome County, N. Y.



This Asylum is admirably situated, overlooking a fine section of country, and is complete in all the appointments of a first-class home, with ample means to meet the wants of every case. It is located three miles from the city, and removed from all temptation. Its management is the same as all other State charities, under the control of a Board of Managers appointed by the Governor. The law provides for the maintenance of indigent inebriates, similar to that of the insane, but patients from other States may be admitted.

The experience of this Asylum, for the past ten years, indicates an increasing usefulness and necessity for such institutions, and the original intention of making this an Asylum Hospital, where this disorder may be thoroughly understood and treated on broad scientific principles is nearer realized than ever before. All rules are strictly enforced, and no patient permitted to go beyond the Asylum grounds without permission from the Superintendent, or in the care of an attendant.

The Charges for Board will include medical care, washing, lights, fuel, etc., with ordinary attention. The exigencies of each particular case will be acted upon, as it may present itself, to those of moderate and limited means as well as the rich.

All inquiries and applications for admission should be addressed to the Superintendent.

DANIEL H. KITCHEN, M.D., Superintendent,
Binghamton, Broome Co., N. Y.

WILLARD PARKER, M.D., New York, N. Y.,
President Board of Managers.

ANIMAL VACCINE VIRUS

OF THE

NEW YORK DISPENSARY.

The New York Dispensary Virus is as well-known if not better than any other Vaccine Virus in the United States, and it still continues to keep up its reputation.

Dr. N. A. Robbins succeeds Dr. Foster as Vaccine Director. Dr. Robbins is well known as a Vaccine Producer, and will maintain the standard of the Virus to its highest point. Liberal terms made with Druggists, Health Boards, and Public Institutions, etc.

Quill Slips (¼ quill charged at square cut end convex surface)..... **$0.25.**
Capillary Tubes,..... **1.00.**

We would recommend Quill Slips as preferable, and in all cases of primary vaccination will fully guarantee.

Fresh supplies of Vaccine, every three days, can be obtained of New York Dispensary, Centre and White Streets.; at Laboratory, 94 Pineapple Street, Brooklyn; New York Hospital, West 15th Street, and of all the leading Druggists in the City.

NEW YORK DISPENSARY, Cor. Centre and White Sts., New York.

In corresponding with Advertisers please mention **The Medical Record.**

THE LATEST IMPROVEMENT IN ATOMIZERS!

For Inhalation, Local Anæsthesia, and Antiseptic Surgery.

Price $4.50, with Handle, Metal and Glass Atomizing Tube.
With Apparatus for giving Fomentations to any part of the Body, **$6.00.**

All joints are hard-soldered. Every one is tested, and they cannot be injured by exhaustion of water or any attainable pressure. It does not throw spirts of hot water. A perfect safety-valve, guaranteed to remain in thorough working order, and never to stick; and connection for steaming any part of the body locally, complete it.

The Apparatus without the Atomizer, - - - **$3.50**
Antiseptic Atomizer, throwing spray for two hours, **10.00**
Stand throwing the spray in any direction, - **5.00 extra.**

Perfect Steam Atomizer.

Perfect Croup Bottle,
For confining and conducting lime fumes and acid vapors in Croup and Diphtheria.

L is a tray with handle. O is a cup which is filled ¼ full of lime and with sufficient water; the warm lime slackens as soon as it becomes hot, and the fumes will escape through the nozzle. If acids are used, place them directly in cup P, so that the steam will pass through the fluids and evaporate them.

Price, complete, with Nozzle for Fomentation, - **5.00**
Atomizer and Croup Bottle combined, - - - **$9 00**

Medicated Steam Bath.

This apparatus consists of a large boiler four times the size of the atomizer, a steam distributor and a cloak, **price $6.00.**

If with nozzle for local application of steam to any part of the body, **$2.00 extra.** With box for carrying, 12 x 6 x 6 inches.

For sulphur baths a lamp to burn the sulphur is supplied, and also a rubber cloak to which is attached a rubber tubing for the purpose of conveying the fumes out of the room, making it a perfect sulphur bath for family use and office practice.

Price of the Sulphur Bath, **$11.00;** with nozzle for Local Applications, **$13.00.**

Send for Illustrated Descriptive Circular to

J. DE BEER, M.D.,

25 Bromfield Street, Boston.

FOUGERA'S COMPOUND IODINIZED

COD LIVER OIL

Since the introduction of this oil in 1858 it has been found to be superior to all other kinds of Cod-Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod-Liver Oil, but also the **tonic, stimulant, and alterative** properties of **Iodine Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod-Liver Oil.

Through its **increased curative action, FOUGERA'S COD-LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod-Liver Oil would fail entirely.

Fougera's Ready-Made Mustard Plasters.

A most useful, convenient, clean and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths:—Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll of 10 plasters each. DIRECTIONS.—Dip the plaster or plasters, a minute or two, in cold water; apply on the part, and cover with a band.

Fougera's Compound Iceland Moss Paste.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, &c. Wakefulness, Cough and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this paste.

Fougera's Iodo-Ferro-Phosphated Elixir of Horse-Radish.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of anti-scorbutic and aromatic plants, and acts as a **tonic, stimulant, emenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

TO ADVERTISERS.—Permit us to direct your attention to "THE MEDICAL RECORD." It has now been published over twelve years, and has become the most popular and most extensively read of any medical journal in America. Its circulation is widespread over the entire continent—probably there are few of the active, intelligent members of the Profession who are not among its regular readers. The value to Advertisers of this large list of subscribers has long been recognized, as practically shown by the great number of pages of advertisements, rendered necessary by the patronage of those who have found that **IT PAYS TO ADVERTISE IN THE MEDICAL RECORD.**

THE MEDICAL RECORD HAS THE LARGEST CIRCULATION OF ANY JOURNAL OF ITS KIND IN AMERICA.

Issues over 800,000 a Year.

ITS CIRCULATION IS WELL DISTRIBUTED OVER THE NORTH, SOUTH, EAST AND WEST.

Recent Testimony of Experienced Medical Advertisers who have Tried it.

GENTLEMEN:—Having advertised for a term of about two years in THE MEDICAL RECORD, I cheerfully express to you my appreciation of its value. Its high professional standing entitles it to the first place as an advertising medium, and the results I have obtained for all my goods through it, verify this. I likewise consider its rates, in proportion of the number of copies which it distributes to the best class of the medical profession, as cheaper by far than most all the so-called, low-priced papers. Very truly yours, F. ALFRED REICHARDT, Pharmacist.
NEW YORK, *January* 30, 1878.

GENTLEMEN:—The results obtained by our advertising in THE MEDICAL RECORD have been very satisfactory, and we cheerfully recommend it as being one of the best mediums for reaching physicians. Yours truly, W. H. SCHIEFFELIN & Co.
NEW YORK, *January* 31, 1878.

GENTLEMEN:—We have renewed our contracts with you this year, as we are well satisfied with our advertisements in your MEDICAL RECORD, which have extended over a number of years. We believe the RECORD to be very ably edited, and its large subscription list of physicians is well merited. Yours respectfully, MCKESSON & ROBBINS.
NEW YORK, *January* 28, 1878.

GENTLEMEN:—Having advertised in THE MEDICAL RECORD almost continuously from the time it was first published, we consider it the best medium for reaching the medical profession of this country. Yours respectfully, CASWELL, HAZARD & Co.
NEW YORK, *January* 28, 1878.

GENTLEMEN:—It gives us great pleasure to speak of the merits of THE MEDICAL RECORD. The able manner in which it is edited and managed give it a wide influence amongst the medical profession of this country. Sincerely yours, WM. R. WARNER & Co.
PHILADELPHIA, *February* 5, 1878.

GENTLEMEN:—Continued advertisement in THE MEDICAL RECORD, lead us to say that we regard it as the *best* journal for reaching the medical profession that we know of, owing to its wide circulation and the thorough manner in which it is circulated. Yours truly,
PHILADELPHIA, *February* 5, 1878. KEASBEY & MATTISON.

GENTLEMEN:—During the time we have had our advertisement in THE MEDICAL RECORD we have found it to be the very best advertising medium, and we beg to say that we cannot recommend it too highly. We have had more orders in consequence of our advertisement in THE MEDICAL RECORD than from all other journals we advertise in combined.
NEW YORK, *January* 30, 1878. F. G. OTTO & SONS, New York.

GENTLEMEN:—Having advertised in THE MEDICAL RECORD for a number of years, we can confidently recommend it to advertisers as one of the best mediums known to us.
NEW YORK, *January* 30, 1878. Yours respectfully, GEO. TIEMANN & Co.

GENTLEMEN:—As constant advertisers in THE MEDICAL RECORD, we are happy to state that we consider the RECORD one of the very best mediums for reaching the medical profession.
NEW YORK, *January* 28, 1878. We are yours truly, E. FOUGERA & Co.

GENTLEMEN:—Your MEDICAL RECORD has been very satisfactory as an advertising medium; nearly every mail bringing orders and inquiries from its readers. From letters received, the "RECORD" must reach all quarters of the globe. Yours truly, A. J. DITMAN, Druggist.
NEW YORK, *January* 28, 1878.

GENTLEMEN:—We are entirely satisfied with the results of advertising in THE MEDICAL RECORD. There is no better medium for reaching the medical profession in the United States.
Very respectfully, TROMMER EXTRACT OF MALT Co.
FREMONT, OHIO, *February* 10, 1878.

WM. WOOD & CO., Publishers, 27 Great Jones St., New York.

TAMAR INDIEN

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris.

To be had of all Respectable Chemists throughout the world.

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution**, which is generally preferred; or of an **elixir**, when a slight stimulant is desired.

E. FOUGERA & CO.'S

MEDICATED GLOBULES.

The form of Globules is by far the most convenient as well as the most elegant form for administering liquid preparations or powders of unpleasant taste or odor. The following varieties are now offered:

Globules of **Ether; Chloroform; Oil of Turpentine; Apiol;**
Phosphorated Oil, containing 1-60th grain of Phosphorus;
Phosphorated Oil, containing 1-30th grain of Phosphorus;
Tar; Venice Turpentine; Copaiba; Copaiba and Tar;
Oleo-Resin of Cubebs; Balsam of Peru;
Oil of Eucalyptus; Cod-Liver Oil; Rhubarb;
Bicarb. of Soda, Sulph. Quinia, &c.

The superiority of these Globules over other forms consists in the ease with which they are taken, and in their ready solubility, and hence promptness of action.

They are put up in bottles of 100 each.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

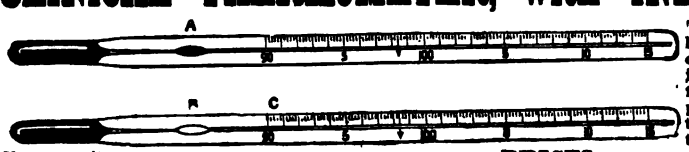
Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

Pharmacien, No. 40 Rue Bonaparte, Paris,
without which none are genuine.

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING

CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



"This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertance in use, or rough usage in traveling, can possibly disarrange it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... $6 00

We also offer:

No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... 3 50

Sent free by mail on receipt of price. Manufactured by L. CASELLA; London.

E. FOUGERA & CO., Agents, 30 North William St.. New York.

In corresponding with Advertisers please mention **The Medical Record.**

Warranted that the register of this thermometer will not unite with the mercury in the bulb A.

F. G. Otto & Sons' Patent Truss Pad.

The advantages this Thermometer possesses over *all others*, consist in the reservoir B, in which the registering part of the mercury is collected, forming a body of oblong shape. The surface of this body being large in comparison to the contracted bore, makes it impossible to unite the register with the mercury in the bulb A.

These Thermometers are well seasoned before graduating, and, consequently, are as correct as they can be made.

PRICES:

Four inch in	fifths,	$4.25
" " "	fourths,	4.00
Five " "	fifths,	4.75
" " "	fourths,	4.50

In Hard Rubber or Boxwood Case, and will be forwarded on receipt of price.

F. G. OTTO & SONS' PATENT TRUSS

Has been described in No. 275 of the MEDICAL RECORD, and has proved to be by far the best of any yet put before the profession.

THE PATENT SPIRAL SPRING RING PESSARY.

The engraving below shows the manner of manufacturing the Ring Pessary. In a spiral spring of brass spring wire about eight coils of thin rounded whalebone are inserted, which is bound loosely by the spiral spring, thus allowing the coils of whalebone to revolve around themselves, giving, as will readily be seen, more elasticity than they would were they bound tightly by a soft wire of any material; the ends of the spring are then screwed together, and the whole covered with soft rubber of exceedingly smooth surface. We manufacture in the above manner the Bow Pessary, Albert Smith's, and all other shapes. *Manufactured only by*

F. G. OTTO & SONS, 64 Chatham Street, New York.

WILLIAM WOOD & CO., Publishers,

27 Great Jones St., New York.

NOTICE. It will please many of our readers to know that the firm of Hegeman & Co., whose failure we noticed in January, have again resumed their business. Mr. Geo. B. Marcher, who for twenty years had charge of the wholesale and manufacturing business of the establishment, has been associated with the concern, and the business will again be carried on as before, at 203 Broadway.

Editorial "New Remedies," April Number.

HEGEMAN'S
STANDARD
PREPARATIONS.

CORDIAL ELIXIR OF CALISAYA BARK, a pleasant and agreeable Tonic for dyspepsia, etc.; for persons living in Fever and Ague districts, it will be found invaluable as a preventive.

FERRATED ELIXIR OF BARK, the most perfect Iron Tonic; a pleasant cordial, containing the active principles of Calisaya Bark and Iron.

TOLU AND LIVERWORT EXPECTORANT, a speedy and certain cure for coughs, hoarseness, and all diseases of the throat and lungs.

GENUINE MEDICINAL COD LIVER OIL, for Consumption, Scrofula, Rheumatism, etc. Our Oil has stood the test of twenty years, and thousands of patients attribute their recovery to its use. It is warranted pure.

NUTRITIVE TONIC.

BEEF, WINE AND IRON.—Our *Nutritive Tonic* is prepared from Extract of Beef, Pure Sherry Wine, and Citrate of Iron, combined with a pleasant form; and, in all cases where an efficacious Tonic is desired, it will be found a most valuable preparation. It is extensively used in all sections, and highly recommended by the most eminent physicians.

HEGEMAN'S
COD LIVER OIL AND LIME.

The name of this Compound of Medicine is undoubtedly well known to very many; in fact, the combination of the Genuine NEWFOUNDLAND Cod Liver Oil and Phosphate of Lime, as prepared by us, has a world-wide reputation as the most potent remedial agent in the treatment of that scourge of our country—Consumption—and more prevalent in our climate than any other section in the world.

We have spared neither pains nor expense in the manufacture of this preparation, and its superior quality is shown in the fact that wherever it has been introduced it has superseded all others.

CHAPPED HANDS AND FACE,

Sore Lips, Dryness of the Skin, &c., &c.,

Cured at once by HEGEMAN'S CAMPHOR ICE WITH GLYCERINE. It keeps the hands soft in all weather. See that you get HEGEMAN'S Sold by all Druggists. Price 25 cents; sent by mail for 30 cents.

MANUFACTURED ONLY BY

Hegeman & Co., Chemists & Druggists, 203 Broadway, N.Y.

FOR SALE BY ALL DRUGGISTS,

Agents for Red Cheek Medicine, Office, 203 Broadway.

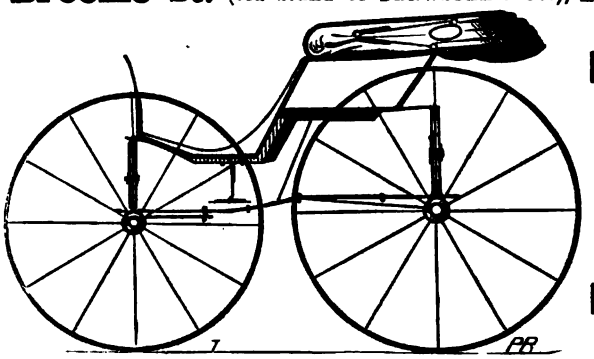
CARRIAGE BUILDERS,

372 and 374 Broome St. (Old Stand of BREWSTER & CO.), **NEW YORK.**

PHYSICIANS' CARRIAGES A SPECIALTY.



PHÆTONS, ROCKAWAYS, BROUGHAMS *And New Style* **PHÆTON-ROCKAWAY**

Having made the various styles of vehicles now in popular use by *Physicians* a leading feature of our business, and being determined to sell

THE BEST THAT CAN BE PRODUCED

At Lowest Prices for Prompt Cash,

We are, therefore, fitting all our Physicians' vehicles and other fine carriages with

THE RUBBER CUSHIONED AXLE.

This great improvement secures the essential objects sought for in every vehicle, viz., **SAFETY, COMFORT,** and **ECONOMY,** and its use indisputably assuring these important and valuable qualities, it is now accepted as an

INDISPENSABLE FEATURE

in carriage building wherever **PERFECTION,** or a near approach to it, is sought to be attained.

Axles in use, where the arms are not much worn, can be altered, using the same wheels if the hubs are sound. Those at a distance may have the alterations made by sending us the axles and wheels only.

SEND FOR ILLUSTRATED CATALOGUE AND PRICE LIST.

HARNESS for PHYSICIANS' USE.

Please mention this Journal.

TO PHYSICIANS.

Excess of *motion, vibration, jarring, jolting, pounding* and *noise* overcome by the use of the

RUBBER CUSHIONED AXLE.

Even rides at long distances can now be made *without discomfort and fatigue.* Wear and tear of the running gear, the wheels especially, reduced over 50%, rendering this

POPULAR INVENTION

a ***money-saving appliance*** in addition to the advantages of ***safe*** and ***comfortable riding*** which it *positively assures.*

Should your carriage builder be unfamiliar with the mechanical principle of "the axle," or the manner of its application, please send us his name and address, which will receive prompt attention.

Used and approved by leading carriage builders everywhere, and endorsed by all who use it. Among the many, we refer, by permission, to the following well-known gentlemen, some of whom have used "the axle" for upwards of two years:—

Rigollot's Paper

is not (as certain storekeepers of bad faith pretend) a production that any one can make;

Rigollot's Paper

is not manufactured with a mustard that every one can buy;

Rigollot's Paper

is one of the most marvelous discoveries of the contemporary pharmacopœia;

Rigollot's Paper

is the invention of M. P. Rigollot who is the exclusive owner, and is the only preparation of the kind which obtained a medal and diploma at the Philadelphia Exposition.

It is sold wholesale at

No. 24, Avenue Victoria, Paris.

All other mustard leaves which do not bear the signature of P. Rigollot are but imitations of his remarkable invention, and should not be bought.

Rigollot's Paper

is the only one adopted by the Civil and Military Hospitals throughout the whole of Europe.

To be had of all the principal Chemists and drug stores in the world.

Insist that the Signature is on each leaf.

P. Rigollot

Mercury, Bin-Iodide.....1-25, 1-16 gr.	**Zinc, Phosphide**.....1-6, 1-4, 1-2 gr.

Physicians have experienced the need of a reliable and pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons; and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our granules have been appreciated and are being extensively used by the profession.

Be careful and see that "McKesson & Robbins" is on the label, and specify McK. & R. on prescriptions.

Full lists furnished upon application to

McKESSON & ROBBINS, 91 Fulton Street, New York.

SOLUBLE PILLS.

170 WILLIAM STREET, NEW YORK, October, 1876.

THE marked increase during the past few years in the demand for Pills made in accordance with the U. S. Pharmacopœia and other recognized formulas, has induced us to commence their manufacture in our own laboratory, and we are now furnishing Coated Pills, which, for beauty of finish, solubility, and general excellence, are unequaled.

The best substances are used in their manufacture. No article required by a formula is omitted on account of its high cost, nor are any pills deficient in weight; so that we can guarantee them to be made in strict accordance with the standard formulas, *both as regards the materials called for and in weight.*

The pills are coated while soft, and the excipients employed are such as preserve a mass readily soluble in the juices of the stomach, thus insuring prompt action.

The coating, which is soluble and so transparent as to clearly reveal the color of the mass, effectually covers any nauseous taste, and renders the pill easy to be swallowed. Its solubility can be readily tested by allowing a pill to rest upon the tongue for a few seconds.

Particular attention is called to our Granules of Morphine, Strychnine, Arsenious Acid, and other powerful remedies, which are prescribed in minute doses. The desirability of having these medicines in this shape, accurately weighed and ready for administering, has long been recognized. We have taken every precaution to insure accuracy in weight, and can give assurance that in this, as in other particulars, they can be implicitly relied upon.

We shall be happy to furnish any samples that may be desired.

NOTICE—See our Advertisement in alternate numbers of the RECORD.

W. H. Schieffelin & Co., 170 and 172 William St., New York.

ALOIN, { THE ACTIVE PRINCIPLE OF ALOES.

MANUFACTURED BY THE DISCOVERERS,

T. & H. SMITH & CO., Edinburgh and London.

"The uniformity in strength of Aloïn, the smallness of its dose, and the certainty of its action should commend it to the favourable consideration of all medical practitioners."—*Vide* Dr. WM. CRAIG'S Investigations, published in *Edinburgh Medical Journal* for May, 1875.

Messrs. SMITH will send free by post a Sample of Aloin to any Medical Gentleman desiring it.

THE RATIONAL TREATMENT OF STRICTURE OF THE URETHRA.

By SAMUEL W. GROSS, M.D.,

SURGEON TO THE JEFFERSON MEDICAL COLLEGE HOSPITAL AND TO THE PHILADELPHIA HOSPITAL.

With the view of obtaining a radical cure, or delaying as long as possible a return of the symptoms, I have long been convinced that the only rational treatment of organic stricture of the urethra is to restore that passage to its normal distensibility at the affected portion. Gradual dilatation, as ordinarily practised, is powerless to effect the object, since the process ceases with the insertion of the largest instrument that comfortably fills the meatus, which, it need scarcely be said, is many millimetres smaller in circumference than the canal behind it. My measurements, which differ very slightly from those of Dr. Weir and Dr. Otis, show that the average meatus is equal to 24 mm., or nearly one inch, in circumference; while the circumference of the spongy portion, which is itself narrower than the bulbous division, is equal to 32 mm., being a difference which is represented by a No. 3 English, or a No. 8 French catheter. If a stricture be seated in the spongy urethra, a No. 24 bougie cannot restore its normal distensibility or calibre, and it is to this fact that the unsatisfactory results of this mode of treatment are to be ascribed.

While it is true, the more particularly if the coarctation be soft and recent, and does not contain elastic fibres, that the symptoms will be palliated, it is equally true, even in strictures of large size, and these are the ones most commonly met with, that after the cessation, or even intermission, of instrumentation, the prominent symptoms are sure to recur. In these cases I have invariably found that the stricture was as clearly defined by the bulbous explorer as it was before the treatment was commenced, thereby affording convincing proof that little progress had been made towards permanent relief. Even after incision of the meatus and the employment of conical steel bougies up to the normal size of the urethra, as determined by previous measurement, I can conscientiously declare that I have never effected a cure, although many patients have been greatly benefited and rendered temporarily comfortable. Hence I only employ dilatation when, from the existence of contraindicating disease of other portions of the urinary apparatus, or from disinclination on the part of the patient to submit to operation, it is the only recourse at my command.

To restore the urethra to its normal calibre it becomes necessary to insert a piece of new, soft, pliant tissue between the divided sides of the cicatricial tissue upon which the narrowing of the passage depends. This may be accomplished, in the great majority of cases, either by divulsion or internal urethrotomy, or by a combination of both procedures, in accordance with the indications presented by each individual case. Previous to the performance of any operation, however, the experienced surgeon will remember that he has to deal with something more than a mere passive obstacle to the free passage of the urine or the introduction of an instrument. In every case there is associated with the contraction a subacute or chronic urethritis, which is a source of spasm and irritability, to the latter of which most of the reflected symptoms are due. Hence, in the rational treatment of this affection the indications are, first, to allay congestion, spasm, and tenderness, whereby the urethra will be placed in the best possible condition for operative interference; secondly, to bring the coarctation up to the normal calibre of that portion of the urethra in which it is seated; and, thirdly, to mitigate or prevent an attack of urethral fever.

I need not detain you with a consideration of the local and general measures calculated to fulfil the first and third indications, as you are perfectly familiar with them. Suffice it to say that upon their proper employment will depend, in great measure, a satisfactory result. In the event of the meatus being the seat of a stricture, or being much smaller than the rest of the urethra, it should be cut, as a preliminary measure, up to the size of the largest instrument that will be demanded in the subsequent management of the case. Another point—and its recognition is of great practical importance, not only in regard to the diagnosis, but also to the treatment—is to search for and remedy strictures seated in the anterior portion of the urethra before operating upon those situated posteriorly. I have found that when a coarctation is present with the first inch of the urethra, or at the meatus and in the navicular fossa, it not only gives rise to spasmodic stricture, but is, as a rule, associated with one or more organic contractions farther back. Thus my notes show that of 180 cases, representing 322 strictures, in 67, or more than one-third, was the trouble seated in that locality. Of these only 7 were solitary, 34 were double, 20 treble, 3 quadruple, 2 quintuple, and 1 was multiple. In other words, in 100 examples of organic stricture within the first inch of the urethra, in only 10 will it be found to be single, while in 50 an additional one will be detected; in 30 two more will be detected, and in 9 several more will be discovered. A knowledge of these facts will lead the surgeon to explore for additional strictures when one is seated at or near the meatus: and if he will bear in mind that coarctations in this locality are very liable to provoke spasm in the deeper portions of the urethra which may simulate an organic contraction, he will not only avoid an error in diagnosis, but also an error in treatment. For this reason, whenever it is possible, I always cut the anterior stricture before I attempt anything farther back.

After these preliminary measures and minor operations have received proper attention, the calibre of that portion of the urethra in which the stricture is seated is determined by the urethrameter of Dr. Weir, or with a somewhat similar instrument of my own device, which, however, possesses no advantages over the former except in being less costly, and, on that account, within the reach of the profession at large. Measurements taken after irritability and spasm have been relieved are far more reliable than when the distensibility of the urethra has been fixed, when the patient is first seen, since, at this time, the use of the urethrameter is liable to provoke spasmodic contraction, which may be mistaken for organic stricture.

With the view of inserting a splice in the contracted part, divulsion or internal incision may be resorted to. Of late years I have practised the former operation less frequently than the latter; not because I deem it unsafe, but because it is not always effectual. On three occasions I had the opportunity of inspecting the urethræ of persons who had died after the procedure in the hands of other surgeons. In one instance the rents were so short that suitable splices could not have been inserted, and, in addition, there were oblique lacerations in the healthy portions of the passage. These appearances are exhibited in the sketch that I

made at the time. In the other two, although the tears were clean and long, there were submucous bands that had resisted the action of the divulsor. Both of these specimens were very similar to Fig. 27, p. 65, of Dr. Gouley's work on "Diseases of the Urinary Organs." In actual practice I have met with the same difficulty. Thus of 29 private cases, all of which recovered without a single accident, and in only two of which was there a chill, which occurred in patients who had not been subjected to preliminary treatment, in 8, or 27 per cent., the operation had to be supplemented by internal urethrotomy, with the view of cutting undivided bands. For these reasons I consider divulsion as being far inferior to urethrotomy; but when the symptoms are urgent, as in the event of retention of urine, or when the patient cannot spare the time for having the urethra sufficiently dilated to admit a cutting instrument, this much-abused procedure possesses undoubted merits, and is worthy of imitation, provided care be taken to search for unruptured bands and submit them to the knife.

Of the two modes of inserting a soft, pliable splice in the contracted part, and in the sound tissues in its immediate vicinity, I give decided preference to internal urethrotomy from behind forwards. As I have pointed out, in forcible rupture, short oblique rents are liable to be made in the healthy mucous membrane, which, after the healing process is completed, may form partial traumatic strictures. In internal urethrotomy, on the other hand, the contracted part can be divided with the utmost precision, while the sound portions of the urethra are free from injury.

Fig. 1.

The instrument which, from the simplicity of its construction, perfection of action, accurate definition of the stricture, and moderate cost, I prefer for retrograde division, is the one devised by myself three years ago. It is nothing more, as may be seen in the woodcut, Fig. 1, than a metallic exploratory bougie, the slender shaft being provided with a handle, and grooved for the reception of a steel rod, to one end of which is attached the blade, and to the other a button, through the retraction of which the former is thrown out of the under surface of the bulb, so that the incision may be made along the floor of the urethra. The extent to which the blade can be projected is regulated by a lateral screw near the handle. The length of the contrivance is eleven inches, of which three are taken up by the handle, button, and screw. In actual practice I have found two such instruments to be all that are required. In one, which is intended for strictures of moderate calibre, the bulb is equal to No. 15 of the French catheter scale; while in the other, the bulb corresponds with No. 23, which suffices to define coarctations of much larger size. In exceptional cases, still larger bulbs may be demanded.

To use the exploratory urethrotome, the stricture having been passed, and its posterior face having been accurately defined by the projecting shoulder of the bulb, the latter is carried at least half an inch towards the bladder—as the object is to cut, along with the coarctation, the sound tissues to that extent behind and in front of it—when the blade is protruded by sliding the button, and the parts divided, as the instrument is withdrawn, the penis being put upon the stretch to render the urethra tense. Should the tissues be thick or resistant, the section may be materially aided by counter-pressure with the fingers of the left hand along the median line. The bulb is then used as an explorer to detect any undivided bands, which, if discovered, should next be severed, since thorough section of all constricting bands is essential to success.

Up to the present time I have used this instrument in forty-six private cases, representing eighty-seven strictures; and I do not include in this number contractions seated within the first inch of the canal, which I divide with a bistoury or tenotome. All recovered; in one there was free hemorrhage, and in six there were rigors; but in two of these there had been no preparatory treatment, while in four the urethra and system had been brought into good condition, but the operation was practised under ether. These are the only cases in which I employed anæsthesia, and I believe that the urethral fever was due partly, if not entirely, to the depressing effects of the agent used, since not a single one of the remaining cases suffered in this way.

It will thus be seen that all of the seventy-five patients subjected to divulsion and internal incision got well; in only one was there embarrassing hemorrhage, while in eight there were chills, which occurred in persons who had either not been prepared for operation, or who were under the influence of ether. These good results I attribute to the care which I exercise in preparing the part and system for operative measures; and I am convinced that, if this precaution be observed, and the kidneys be healthy, little need be feared from divulsion or internal urethrotomy.

Such is a brief outline of the practice, which is essentially that of Dr. Otis, that I have heretofore resorted to for restoring the diseased urethra to its natural dimensions. Recognizing the facts that the canal varies in its capacity for distention in its different divisions, and that no two urethræ are alike in regard to their normal calibre, no limit was placed upon the size of the bougies employed in the subsequent treatment, as each case had to be managed upon its individual merits. Hence, there are certain disadvantages in this method, which depend upon the normal anatomy of the urethra. Not only, in the vast majority of cases, does the meatus require to be enlarged, as a preliminary measure—and I have only met with two examples in which the size of that orifice corresponded with the size of the passage behind it—but violence is liable to be inflicted upon the sound portions of the canal, which correspond to its actual normal contractions at the end of the navicular fossa and at the bulbo-membranous junction, and occasionally to one present about an inch in advance of the latter locality, or possibly others in the spongy portion, as demonstrated by Dr. Weir.*

To place the subject in a clearer light, let it be assumed that a stricture is seated in the middle of the spongy portion, which latter equals 32 mm. in circumference, while the meatus measures 24 mm. To act efficiently upon the coarctation, an instrument 32 mm. in circumference must be passed; but to do this, the orifice will have to be divided to the extent of producing, in many instances, a deformity. In addition to this operation, which is not only painful, but is inconvenient to the patient on account of the hemorrhage which attends the subsequent passage of the bougie, with a view to keep the lips of the incision separated during the healing process, an instrument of the size specified is liable to sever not only the natural

* New York Medical Journal, April, 1876, p. 377.

contractions at the end of the navicular fossa and at the commencement of the membranous portion, if it be carried so far back, but also to produce one or more tears in the ante-bulbous urethra, as is exemplified in the sketch, and is further illustrated by two cases recorded by Dr. Gouley.* In the event of the stricture being seated in the bulb, the meatus will have to be cut still more freely, while the danger of tearing sound tissue will be greatly increased.

From these considerations, which are not theoretical, but are based upon actual observations, I have arrived at the conclusion that enlargement of the meatus is uncalled for when the relation between its size and that of the spongy urethra is normal. Hence, I have been trying for some months past, to devise an instrument with which, after divulsion or internal incision, the severed parts could alone be stretched during the healing process, without detriment to the remainder of the urethra, and I have finally succeeded in perfecting the dilator shown in Fig. 2. It consists of a No. 16 steel sound, the terminal two-thirds of which are split into two halves to form the blades. These are united at the vesical extremity, where they are carefully bevelled, and can be separated laterally, so as to form a spindle-shaped body, by a flattened cone attached to a rod, which is acted upon by a wheel at the proximal end of the handle, the extent to which the blades can be parted being indicated by a register, marked in millimetres, attached to the handle.

FIG. 2.

In using the instrument, the blades are expanded sufficiently to traverse the meatus without overstretching it, when its centre is made to correspond with the divided stricture, and the wheel is slowly turned until the register indicates that the desired degree of distention has been reached. By reversing the wheel, the blades are approximated and the dilator withdrawn.

In the event of the meatus being congenitally contracted, or smaller, from any cause, than it ought to be, it should be enlarged only to the extent of being 8 mm. less in circumference than the spongy portion of the urethra. By preserving these normal relations,† which are obviously intended to increase the projectile force of the seminal fluid and the stream of urine, the natural functions of the urethra will be preserved, extensive cutting will be avoided, and the patient be spared suffering and discomfort.

As the sides of the expanding cone of the dilator protrude through narrow ovoidal openings in the blades, the instrument may be used as an explorer to define the anterior face of a stricture, when it may be employed for ordinary dilatation, by gradually and progressively expanding the blades; or it may be utilized as a divulsor, by rapidly turning the wheel. I have recently resorted to it on two occasions for forcible rupture, and found that it answered every purpose.

With regard to the ultimate results of the operation as practised in the way that I have described, my experience is, as yet, too limited to speak authoritatively.

Within the past month I have twice used the dilator, instead of conical steel bougies, after internal incision, and I have every reason to be satisfied with its action.

It is proper to state that Dr. Gouley * has described an instrument which he has found advantageous not only for overstretching the passage in cases of granular urethritis, but also for replacing conical steel bougies in the process of gradual dilatation, whereby he does away with division of the meatus.

In conclusion, I may be permitted to incorporate the substance of the preceding considerations in the following axioms:

1. The rational treatment of stricture of the urethra consists in restoring the natural expansibility, or calibre, of the affected portion of the canal.

2. Before any operation, having this end in view, is practised, the sensibility of the urethra should be obtunded, lest it resent the violence to which it is about to be subjected.

3. After the spasm and hyperæsthesia have been relieved, the calibre of that portion of the urethra in which the stricture is located should be estimated by the urethrameter, with the view of bringing the affected portion up to that standard.

4. Internal urethrotomy from behind forwards is the most effectual mode of accomplishing that object.

5, and finally. The meatus should not be interfered with, provided its circumference is eight millimetres less than that of the spongy urethra.

[See discussion on paper, page 475.]

THE NEW YORK ORTHOPÆDIC DISPENSARY AND HOSPITAL.—Surgeon Shaffer's report for 1877, together with considerable information respecting the best methods of treatment, evidences a rather startling aggregate of spinal and other deformity, giving statistics of 986 cases, of which, however, only 407 were new. Of the whole number 256 were cases of hip-joint disease, 299 of humpback, 70 of white swelling, 56 of lateral curvature, 73 of deformities arising from infantile paralysis, and 62 of club-foot. Of the twenty-eight cases of hip-joint disease reported cured one has been under treatment for ten years, and one only three months; the average period for them all having been three years and three months. Still more obdurate were the sixteen cases of humpback reported cured; the average period of treatment having been six years. Nevertheless, Dr. Shaffer regards lateral curvature as the most obstinate deformity that he has been called upon to treat. He reports cures in only three cases out of fifty-six, while of the whole number of cases of club-foot ten have been radically cured. Of the twenty-five deaths eighteen were associated with white swelling. Only ten surgical operations were performed during the year, of which eight were for the relief of club-foot.

* Op. cit., Case III., p. 63, and Case V., p. 65.

† I believe that the meatus and spongy urethra in front of the bulb bear almost constant relative proportions to each other, so that the former really constitutes a gauge for the latter. Weir's estimates, based upon 114 measurements, show that the average meatus is 24.91 mm. in circumference, while the average spongy urethra averages 32 mm. Otis, from 100 observations, fixes them, respectively, at 24.72 mm. and 32.95 mm., while I have found them, in 83 trials, to be 24 mm. and 32 mm.

* Op. cit., Fig. 17, p. 45.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, June 15, 1878.

AMERICAN MEDICAL ASSOCIATION.

THE American Medical Association was a success, in the ordinary acceptation of the term; that is to say, the usual interest was manifested in the proceedings, and a goodly number of delegates and permanent members were present. The ordinary routine business was transacted with becoming dispatch, and altogether the dignity of a deliberative body of scientific medical men was well maintained. Some of the questions were, as we expected, almost hackneyed beyond the further tolerance of discussion; but courtesy and good feeling prevailed in favor of the tireless agitators, and they at least were satisfied.

The homœopathic question was brought before the Association in one of its many phases, as a sequel to a report by the Judicial Council. Charges were made last year against a member of the Faculty of the Michigan University for teaching medicine to students of said university who intended to practise homœopathy, it being claimed that such a proceeding was in violation of the letter and spirit of the code of medical ethics. The Judicial Council, in a special report upon the matter, failed to find any actual violation of the code, and was not inclined to take the responsibility of any decision in the premises. So far the action was judicious, conservative, and liberal. It is to be regretted, however, that as much cannot be said of subsequent proceedings bearing upon this question, and that the Association was tempted to recommend an addition to the code so openly opposed to the tolerance of medical opinion. The action was, in our judgment unnecessary, and really beneath the dignity and foreign to the recognized purposes of the Association. Indeed, we go farther by assuming that the Association exceeded its authority in attempting to place an embargo upon medical education by making the acquisition of the latter purely conditional with any arbitrary rules which it may adopt. This is so contrary to the spirit of our free institutions, to all the broad and liberal principles upon which our government is founded, that it appears not only absurd, but ridiculous. No one is accountable to any college or teacher for the use he shall make of his education, provided said use is not contrary to law, order, or morality; and no teacher has a moral or legal right to deny any educational advantages to a student simply because he does not choose to apply his knowledge in a particular way. We cannot resist the conviction that the proposition of the Association is in the direction of a long step backward, and savors of an intolerance which involuntarily arouses the antagonism of all true friends of progress. If homœopathy is founded on an exclusive dogma, we must overcome it by showing our own liberality in matters of opinion. We must treat the question by contraries rather than by similars. If homœopathy is founded on ignorance, the more education we give its prospective followers, the more effectually can we overcome the pernicious influences of its system. The principle proposed by the Association is wrong from beginning to end, and is a reflection upon the judgment and common sense of the whole regular profession.

The work in the Sections—an account of which must be deferred until the succeeding issue—was well performed, notably in that of the Surgical and Obstetrical. The question of shortening in fractures came up, and was settled in a very satisfactory way. Notwithstanding the radical assertion of one gentleman to the contrary, the Surgical Section promptly reaffirmed its previous decision, to the effect that, despite the most judicious plans of treatment known to surgeons, shortening after fractures of the long bones was the rule. So far as the matter may be one of mere individual opinion, it would be safe enough to leave it to rest upon its own merits, as each surgeon is capable of drawing his own conclusions based upon his own experience and observation. But the case is very different when an attempt is made to commit the profession authoritatively to a statement which is contrary to general experience. The deliberate expression of such an opinion, especially on such a subject extends beyond the pale of strictly professional influences, and, from a medico-legal point of view, has an importance which can scarcely be overrated, in giving every surgeon sued for malpractice a proper defence.

The President's address was well-timed, appropriate, and suggestive. The school question received its due share of attention, and the Association gracefully acknowledged the work of "the Apostles of School Hygiene in New York" by advocating medical representation upon educational boards. But it would be useless to allude in detail to the multitude of topics discussed, and so we refer our readers to our report.

Reports of Societies.

AMERICAN MEDICAL ASSOCIATION.

TWENTY-NINTH ANNUAL MEETING,

Held in the city of Buffalo, June 4, 5, 6 and 7, 1878.

TUESDAY, JUNE 4TH.—FIRST DAY.

THE Association met in St. James' Hall, and was called to order at 11 A.M., June 4, 1878, by the President, DR. T. G. RICHARDSON, of New Orleans, La.

Prayer was offered by Rev. L. Van Bokkelen, M.D.

The President invited Drs. S. D. Gross, of Philadelphia; Bowditch, of Boston; N. S. Davis, of Chicago, and J. M. Toner, of Washington, to take seats upon the platform.

DR. THOMAS F. ROCHESTER, of Buffalo, Chairman of the Committee of Arrangements, then delivered the

ADDRESS OF WELCOME.

In the name of the citizens of Buffalo and of Erie County, he extended a most cordial welcome to their city, to their hospitality, and to all that was within their power to offer towards the reaching of three objects for which the Association assembled:

1. The general good and advancement of medicine;

2. The making personal acquaintance with each other;

3. The taking a little of what was so often prescribed—namely, wholesome recreation.

To that end a most cordial welcome was extended to visit the various public buildings in the city, the prison, the alms-house, the Niagara elevator, the hospitals, the Institution for the Instruction of the Deaf and Dumb, the Medical College with its museum and laboratory, the public parks—in short, the physicians of Buffalo, through Dr. Rochester, resolved themselves into a "committee of the whole," and placed themselves at the service of the American Medical Association.

The report of the Committee of Arrangements on

THE CREDENTIALS OF MEMBERS

was read by the Secretary of the Association, Dr. Atkinson, of Philadelphia. As the names were read it was seen that a large number of the States were represented.

CHARGES AND PROTESTS.

DR. P. J. DWYER presented charges against the Medical and Surgical Society of Grand Rapids, Michigan.

The Arkansas State Medical Society presented a protest against the admission of certain members from Hot Springs, Arkansas.

Also a protest against the acceptance of Dr. James M. Keller, of Arkansas, as a member of the Association.

DR. KELLER rose to a question of privilege, and made explanation to the effect that the man who made the protest against his (Dr. K.'s) acceptance by the Association was the man who had been expelled from the Arkansas State Medical Society upon charges preferred by himself (Dr. K.).

The charges and protests were referred to the Judicial Council.

MEMBERS BY INVITATION.

DR. ROCHESTER made the following announcement of members by invitation: All the members of the Erie County Medical Society not now delegates or permanent members of the Association; Drs. George W. Stone, United States Marine Hospital Service; F. Lange, Kiel, Germany; and Edward Hutchinson, of Utica, N. Y.

FOR PERMANENT MEMBERS:

Drs. George I. Northrup, of Marquette, Mich., Stanford E. Chaille, of New Orleans, La., and L. G. Thacker, of Defiance, O.

The report was adopted.

TELEGRAM FROM DR. J. MARION SIMS.

The Secretary read the following telegram from DR. J. MARION SIMS, now in Paris:

"President American Medical Association—May your meeting be harmonious and contribute more than ever to the advancement of medicine. Truly sorry I cannot be with you."

PRESIDENT'S ADDRESS.

DR. JAMES P. WHITE, of Buffalo, Chairman of the Reception Committee, introduced the President, DR. RICHARDSON, who proceeded to deliver the annual address.

The vast benefits which the Association had wrought in uniting the interests of the profession in all the different sections of the country; the encouragement which it had given to a higher culture; the valuable contributions which it had made to some departments of medicine, and the dignified position which it had gained in the eyes of the whole nation, had been so often descanted upon by his predecessors, that it might seem somewhat trite and unprofitable to refer to them again; and yet there was one point which deserved to be brought to the attention of the Association anew, and that was

MEDICAL EDUCATION.

Although more than a generation had passed away since the first meeting of the Association in the city of New York, but few of the original members clustered around the venerable form of him whom we all delighted to honor as its projector and the ever-watchful guardian of its interests. The two most prominent objects in the minds of the earnest men who composed that assembly were the improvement of the system of medical education in the United States, and the elevation of the standard of requirement for the professional degree. It was equally well known that, down to within a very few years past, all the numerous efforts in that direction seemed to accomplish no permanent good, and the philanthropic and enthusiastic reformers, with the exception of a few hopeful and unconquerable spirits, had come to consider the cause as almost wholly lost. Although the result had been so discouraging, yet the Association was to be congratulated upon the evidences, which were now developing, that its work had not been in vain. It was true that the method of mixed teaching practised by the schools more than half a century ago was generally followed; but it must be clear to all unprejudiced observers that there was a growing dissatisfaction with the imperfections of that method, and a disposition to adopt the only philosophic plan, known as the graded system, which prevailed throughout all the other civilized nations of the world. We had just found out that the plan which we formerly

pursued of making war directly upon the medical colleges, endeavoring to compel them to conform their practices to our theories, or else surrender the prerogatives to which they had been so long accustomed, was altogether a mistake, and probably deserved the partial defeat which it encountered.

It was only by capturing the grand army of the profession throughout the country, from which the colleges derived their material and moral support, that we could reasonably hope to bring those institutions to terms. To that end there should be a more

THOROUGH ORGANIZATION

of State and County District Societies, and the President suggested that the Association adopt some uniform plan by which the sixty thousand physicians in the country might be encouraged to unite in district organizations, and through their representatives establish a living union with this, the central legislative body. When that was effected, no honest faculty would dare confer a diploma upon an unworthy candidate.

Leaving this subject, Dr. Richardson passed to the consideration of the question of

ORIGINAL INVESTIGATION.

In view of the very small amount of work that had been done in that direction in this country, it was suggested that it might be the duty of the Association to do something more than it had done to foster the spirit of investigation and discovery in those departments which related directly to medicine.

METHODS SUGGESTED.

Two methods of effecting that were suggested. One was to endeavor to concentrate the influence of the entire profession throughout the country upon the Federal Congress, with the view of convincing its members of the importance of scientific enterprises.

He was not prepared to propose a plan sufficiently elaborated to justify submitting it to the Association with the view of having it brought before the authorities at Washington. Yet it seemed to him that in the Army Medical Museum and Library the general government had, unintentionally no doubt, already founded a school, which, through the influences just indicated, might possibly be made the nucleus of a great national institute, in which original research in all the sciences upon which medicine more immediately drew could be conducted with the same wisdom and efficiency which characterized its present management.

The second method suggested was to incorporate the Association, and then stimulate to original investigations by offering prizes.

The President then passed to the subject of

STATE MEDICINE.

The objects of State medicine were threefold:

1. The prevention or arrest by official measures of all diseases which were not in their nature strictly limited to the individual, but which, from external causes, or from their specific characters, had a tendency to spread throughout families, institutions, and communities, and which could not be otherwise controlled.

2. The qualification of men by suitable education for the duties involved not only in the practice of medicine, but also of public hygiene, the State not only directing the studies which they should follow, but determining by examination when they had reached the standard of acquirement necessary for the proper performance of their great trusts.

3. The enactment and enforcement by the State of such laws as would secure to every citizen the benefit of the services of the best professional experts in all questions of a medico-legal character.

With a view of arriving at desired results in that department, it was suggested that a committee of leading sanitarians be appointed to prepare a somewhat elaborate address to the profession and the public, setting forth the transcendent importance of the subject, presenting a summary of sanitary science, pointing out the best methods of studying and teaching the same, and demonstrating the great benefits to be derived therefrom by the individual and the community in general. Without attempting to portray the special features that should appear in such an address, Dr. Richardson took the liberty of saying that it should not omit to insist upon the great necessity of teaching the young not only the laws of health, but the elements of physiology, which were essential to a proper comprehension of the principles of hygiene.

It had been proposed not to await the necessarily slow march of sanitary intelligence among the people, but to petition the Federal legislature at once to create a sanitary department in the general government, with an officer at its head who should be assisted in the performance of his duties by a

NATIONAL COUNCIL OF HEALTH,

composed of members from every State in the Union.

Dr. Richardson, however, believed there were but two great questions in State medicine which we could reasonably hope to have solved by Federal legislation. One concerned seaboard quarantine, and the other the pollution of water-courses. It was doubted by many eminent statesmen whether even those could be brought under Federal control; and yet the recent passage by Congress, of "an act to prevent the introduction of contagious and infectious diseases into the United States," encouraged us to hope that something might be expected from that quarter.

Whatever doubts there might be as to the extent of the authority possessed by the central government, there seemed to be no dispute that within the limits of each separate State resided a power which, with reference to all such matters, was practically supreme. It was, therefore, upon that power that the State medical societies should concentrate all their influence, professional and social, to effect the necessary legislation. They should employ their best endeavors to have

STATE BOARDS OF HEALTH

created where they did not at present exist, and they should by all means secure the right of nomination for appointments upon such boards. Whatever plan, however, might be advocated by societies, it should be borne in mind, in recommending legislation, that while it was true that a people ignorant of even the elements of hygiene could not be brought under sanitary legislation except by restraint, such restraint should be used with the greatest caution and moderation, and be sustained by an appeal to the common sense of those to whom it was applied. He therefore repeated with added emphasis the sentiment already expressed, that the hope of progress in State medicine was in the education of the people.

On motion made by Dr. Gross, the thanks of the Association were tendered to Dr. Richardson for his admirable, excellent, highly elaborate, and eloquent address.

On motion made by Dr. White and seconded by Dr. Gross, the President's address was referred to a

committee of *five*, of which the President was chairman. The remainder of the committee consisted of Dr. Richardson's *four* immediate predecessors.

REPORTS OF DELEGATES.

DR. WILLIAM BRODIE, of Detroit, made a report as delegate to the Canadian Medical Association.

Special mention was made of a paper read by Dr. James Workman, of Toronto, on "Crime and Insanity," which was read in the general meeting, and, after a full discussion, led to the adoption of the following resolution:

"*Resolved*, That, in the opinion of this Association, it is desirable, in all criminal trials, when medical opinion suggests the possibility of mental unsoundness, the accused should be placed under the supervision of experts for a sufficient time to enable them to determine whether he or she was insane or not at the time the crime was committed."

DR. LEWIS A. SAYRE, of New York, made a brief verbal report as delegate to the British Medical Association, which met in Manchester in July, 1877.

UNIFORMITY OF OBSERVATION AND RECORD.

DR. E. SEGUIN, of New York, made a report as delegate to the International Medical Congress of Geneva:

The Delegates of the American Medical Association to the International Medical Congress of Geneva were charged: "To advocate the adoption of a progressive uniformity of means of observation and record, with the concurrence, if possible, of the members of this Congress who would be found there engaged in advocating the application of uniformity in this and other departments of science."

The question was brought before the British Medical Association, and also before the French Association for the Advancement of Science prior to the direct mission at Geneva. The subject was carried from the Section of General Medicine to the General Congress, and the following resolutions were adopted:

For physicians and surgeons, the principle accepted by the Congress is a gradual international uniformity of their nomenclatures, scales, measures, calibres of instruments; of the records of private and hospital practice, of physiological experiments, of medical climatology, barometry, thermometry, statistics, etc.

In pharmacy the Congress of Geneva has accepted the conclusions voted at St. Petersburg and Brussels, as presented by Profs. Gille and Matsen:

1st. The adoption of a universal pharmacopœia, to be written in Latin.

2d. The decimal system for weights and measures, and the Centigrade scale for temperatures.

3d. A uniform nomenclature (probably that of Berzelius).

4th. The chemical preparations to be of determined strength and purity, and the pure drugs to be of essayed strength, if possible.

5th. The Galenic preparations made as simple as possible, and described according to a uniform plan.

6th. The other pharmaceutical preparations to be made uniform (that is, those which are powerful, like tinctura opii, aconiti, nucis vomicæ, hashish, podophyllin, elaterium, etc.).

7th. Physicians to be left free and responsible for the non-officinal ingredients and doses of their magistral prescriptions.

MARION SIMS,
THOMAS DRYSDALE,
EDWARD SEGUIN.

The reports were all accepted, and referred to the Committee of Publication.

The Association then adjourned to meet on Wednesday, at 9.30 A.M.

WEDNESDAY, JUNE 5TH.—SECOND DAY.

The Association was called to order at 9.30 A.M., by the President, Dr. Richardson.

MEMBERS BY INVITATION.

DR. ROCHESTER reported the names of the following gentlemen as members by invitation: Drs. Bray and Murphy, of Chatham, Ont.; J. E. Graham, M.D., of Toronto, Secretary of the Toronto Medical Society; Dr. T. Mack, Dr. T. Clark, of St. Catherine's; Dr. McCargo, of Caledonia, Ont.; Dr. Dunn, of Lodi, N. Y., and Dr. George Rightmire, of Jacksonville, N. Y.

FOR PERMANENT MEMBER.

Dr. Wm. S. Tremaine, U. S. A., Fort Dodge, Kansas.

Drs. Clark, Trenholme, and Botsford, delegates from the Canadian Medical Association, were invited to take seats upon the platform.

REPORTS FROM THE JUDICIAL COUNCIL.

The following report was presented by the Judicial Council:

The charges against Dr. J. M. Keller, presented by Dr. G. W. Lawrence, were dismissed as being unworthy of any consideration.

The charges against the Society of Grand Rapids, Mich., presented by Dr. P. J. Dwyer, were unsubstantiated and unaccompanied by witnesses and testimony whereby the Judicial Council might be able to act.

The Arkansas petitions referring to the State Medical Society were dismissed without action.

The charges against the Michigan State Society, by Dr. W. W. Jones, would be reported upon by Dr. N. S. Davis, Chairman of the Judicial Council.

The charges against W. T. Barr, M.D., of Abingdon, Va., presented by Dr. Ulrich, of Chester, Pa., were dismissed by the Council.

S. N. BENHAM, M.D., Secretary.

P. S.—In reference to the communication from the State Medical Society of Arkansas, notifying the Association that the Hot Springs and Garland County Medical Society was not recognized by the State Medical Society and protesting against the reception of any member of that Society, it is decided that under the by-laws of this Association said Hot Springs and Garland County Society loses its recognition with the Association from date of its severance from the State Society.

A PHASE OF THE HOMŒOPATHIC QUESTION.

DR. N. S. DAVIS made the following appended report of the Judicial Council concerning the charges against the Michigan State Medical Society, referred by the Association at the Annual Meeting in June, 1877:

"The charge in this case was alleged violation of the Code of Ethics on the part of the Michigan State Medical Society, in electing as a delegate to this Association Dr. E. S. Dunster, of the University of Michigan, knowing him to be engaged in aiding and abetting the graduation of students devoted to an exclusive dogma in medicine.

"After a most careful examination of the Code of Ethics, as it has appeared in the Transactions of this Association from year to year, the Judicial Council

fail to find any section or paragraph in it that refers even remotely to the practice that constitutes the foundation of the charge under consideration. That any member of the medical profession proper should ever engage in teaching, examining, and certifying to the qualifications of students, knowing that such teaching and examination was to aid said students in obtaining a diploma directly admitting them into a fraternity of irregular practitioners was evidently not contemplated by the framers of our Code of Ethics; and hence they inserted no clause or section bearing upon that subject. The only provision in the Code referring to those engaged in an attempt to practise medicine in accordance with some 'exclusive dogma,' is in the section regulating consultations at the bedside of the sick. If the Judicial Council of this national organization should assume that the section of the Code just referred to indicated the 'spirit' of those who framed and adopted it, and on that assumption apply it to matters and practices entirely foreign to those mentioned in the doctrine itself, it would not only violate all the accepted principles of judicial construction, but would establish a precedent in latitudinous construction of the Ethical Code more dangerous to the best interests of the profession than all the evils sought to be remedied in the case under consideration.

"It is true that this Association has adopted at different times two resolutions, having reference to the subject involved in the charge against the Michigan State Medical Society, which still stand as expressions of opinion unrepealed. But these resolutions constitute no part of the Code of Ethics; neither is obedience to them enjoined by the constitution and by-laws on State and local medical societies as a condition of representation in this Association. Therefore, while deprecating the practice of aiding or abetting in any way the teaching and graduation of students known to be supporters of irregular and exclusive dogmas in medicine, as beneath the dignity of right-minded teachers of an honorable and liberal profession, your Judicial Council can find no clause in either the constitution, by-laws, or Code of Ethics, as they now exist, under which the charge against the Michigan State Society can be entertained and adjudicated."

Dr. Toner, of Washington, in view of the fact that there was an unwritten law which governed such cases, moved to refer the report made by Dr. Davis back to the Judicial Council.

The motion was seconded and discussed by Dr. Busey, of Washington, and also discussed by Drs. Toner, Davis, Woodward, Brodie, and Menees.

The hour for the next order of business having arrived, the question was passed over without action.

Letters from Dr. B. A. Vaughn, of Columbus, Miss., and Dr. Robert Battey, of Rome, Ga., expressing regret at not being able to attend the Convention, were next read, and ordered entered upon the minutes.

ADDRESS OF DR. H. H. SMITH, OF PHILADELPHIA, CHAIRMAN OF THE SECTION ON SURGERY AND ANATOMY.

Dr. Smith departed somewhat from previous custom in relation to the character of the addresses from the chairmen of the Sections, and selected a single subject, to which he directed the attention of the Association. The subject was:

CERTAIN POINTS IN THE PATHOLOGY OF THE BONES, ESPECIALLY TUBERCLE.

Recently a new function had been assigned to the skeleton, and the bones had been regarded by many as a focus for the origin of red and white blood-corpuscles, and through which diseased matter was introduced into the general circulation. Certain results which followed operations on the bones—such as erysipelas, septicæmia—were doubtless due to impairment of the blood-forming functions of the myeloid cells in the medullary portion.

It was suggested that the cases of bone and joint disease, which had been reported as due to exanthematous fevers (Gibney), were perhaps cases in which the first departure from health was in the medulla of the bones, and that the exanthemata were symptoms, and not causes.

Passing to the consideration of

TUBERCLE IN BONE,

Dr. Smith gave a *résumé* of the opinions which had been given by Virchow, Rindfleisch, Wilson Fox, Rodenstein, of Yonkers, N. Y., and others, regarding the character of tubercle, and from those opinions reached the conclusion that tubercle was formed from the blood through the action of the lymphatic vessels.

The conclusion reached by Dr. Smith was—

1. That tubercle was closely connected with the lymphatics, and that it was deposited in the lymphatic vessels in Pott's disease, also in the epiphyses of the long bones as well as in the spongy bones of the ankle-joint.

2. That its development and progress in these localities was the same as when deposited in other tissues.

3. That tubercle affected the vessels and cancellated structure of the bones, and not the ligaments and cartilage.

4. That the destruction of cartilages and ligaments was the effect and not the cause of impaired nutrition.

5. That softening tubercle produced congestion and inflammation of the bone-cells about the deposit.

6. That perverted myeloid cell action was consequent upon such change, and reacted in the way of modifying the formation of blood-corpuscles.

7. That what was termed scrofulous disease of the bones was essentially a disturbance of the myeloid cells.

The practical lesson to be derived from such facts was that we should still hold to the teachings of our forefathers, and let constitutional treatment form an important and leading part of the management of the case, and that

MECHANICAL APPLIANCES SHOULD BE SECONDARY.

With reference to Pott's disease, Dr. Smith took the open position that *external violence* had nothing whatever to do with it, but that destruction of the cancellated structure of the vertebra was the result of caseous deposit and evacuation of softened tubercle.

He also believed that hip disease was due to the same cause, and that the cancellated structure was first affected. The treatment of Pott's disease by suspension was at least two hundred years old, and the splint which kept the diseased surfaces in hip disease apart was an admirable instrument; but no matter what the mechanical apparatus might be, it should not supplant a proper tonic and alterative plan of treatment.

The treatment of phthisis by injecting the cavities in the lungs had met with some success in the hands of Dr. Pepper, of Philadelphia, and it might yet be a plan of treatment for bone disease to inject the cancellated structure with substances such as phosphoric and lactic acids, etc., which favored the evacuation of the caseous material.

The address was referred to the Section on Surgery.

INTERVENTION OF PHYSICIANS IN EDUCATION.

In the Section on State Medicine and Public Hygiene, June 4th, Dr. E. Seguin, of New York, read a paper upon the above subject, and it was referred to the general Association.

Dr. Frank H. Hamilton, of New York, in behalf of Dr. Seguin, presented the paper, from which he read several extracts, and then opened the discussion. He spoke at some length, and made special reference to the hygienic condition of the public-school rooms in the city of New York, and how unavailing all efforts thus far had proved in the way of securing a medical representation in the Board of Education. The only remedy for correcting the growing evils in connection with school hygiene was in an united action upon the part of the medical profession. Dr. Hamilton closed his remarks by the introduction of the following resolution, which was unanimously adopted:

"*Resolved*, That in the opinion of this Association medical men ought to have a voice in the construction and location of public-school buildings; in the question as to the age at which children should be admitted, the hours of study, the size of type used, and the general management of these institutions; and to this end it is believed to be necessary that one or more intelligent physicians should be placed upon Boards of Education, Boards of Trustees, and upon other similar boards having the control of public education and schools."

Owing to the lateness of the hour, farther discussion was prevented, and the President introduced

Dr. E. W. Jenks, of Detroit, Chairman of the Section on Obstetrics and Diseases of Women, who delivered an address upon

THE CAUSES OF SUDDEN DEATH IN PUERPERAL WOMEN.

After reviewing the literature of the subject, Dr. Jenks studied his subject under four heads:

1. Lesions of the Circulatory System.
2. Lesions of the Respiratory System.
3. Lesions of the Nervous System.
4. Puerperal Septicæmia.

The following conclusions were reached:

Septicæmia in its most malignant form was one of the chief causes of sudden death in puerperal women, and it was more than probable that small and large emboli were formed by the disorganizing effect which that condition produced upon the white blood-corpuscles.

Of the various valvular lesions of the heart, mitral stenosis was the most dangerous for the pregnant or puerperal woman. The usual mode of sudden death with the valvular lesions was through pulmonary œdema.

Endocarditis, old and recent, was extremely liable to be rekindled in the puerperal condition, result in ulcerative puerperal endocarditis, and give rise to embolism. The practical deduction was that women who had suffered from endocarditis should be discouraged from getting married, lest embolism and sudden death should occur in the puerperal condition.

Endocarditis might result from one of the forms of puerperal fever.

Fatty heart was a possible cause of sudden death in the puerperal woman. Only two cases, however, had been reported, and one was by Dr. Jenks.

Arterial degeneration might cause sudden death in the puerperal woman in two ways: 1. By allowing rupture of the vessel. 2. By favoring the development of thrombosis and embolism.

Arteritis of itself rarely caused sudden death in the puerperal woman.

Phlebitis was a frequent source of sudden death in these cases, terminating in pulmonary obstruction.

The injection of large quantities of air into the veins caused sudden death, but relatively the entrance of air into the veins of the puerperal woman was an infrequent cause of sudden death. The introduction of the hand into the uterus occasionally caused sudden death by facilitating the introduction of air into the veins.

Puerperal eclampsia was a most conspicuous cause of sudden death, but the mortality in that class of cases had been very much decreased by the progress which had been made in treatment.

Tetanus might give rise to sudden death in the puerperal woman.

Every physician should feel bound by professional obligation to thoroughly study the pathological anatomy of any case of sudden death, with the view, if possible, of arriving at the cause of death in any case which came under observation.

There were many other causes, such as ruptured heart, ruptured uterus, apoplexy, profound moral emotion, post-partum hemorrhage, mental excitement, shock, traumatism, etc., which were well recognized, and for that reason their special consideration was omitted.

The address was referred to the Section on Obstetrics.

COMMITTEE ON NOMINATIONS.

The Committee on Nominations was announced as follows: A. Linthicum, Arkansas; J. F. Bancroft, Colorado; B. H. Catlin, Connecticut; J. M. Toner, District of Columbia; W. F. Westmoreland, Georgia; Moses Gunn, Illinois; Jas. F. Hibbard, Indiana; G. P. Hanawald, Iowa; C. V. Mothram, Kansas; J. M. Bodine, Kentucky; O. P. Langeworthy, Louisiana; C. T. Collins, Massachusetts; T. B. Evans, Maryland; S. H. Weeks, Maine; J. R. Thomas, Michigan; C. P. Adams, Minnesota; W. M. Compton, Mississippi; J. M. Allen, Missouri; S. Lilly, New Jersey; J. P. Gray, New York; Dr. Adams, New Hampshire; Chas. Duffee, Jr., North Carolina; J. W. Russell, Ohio; A. Fricke, Pennsylvania; T. C. Lawton, Rhode Island; J. H. Van Deman, Tennessee; J. L. Cabell, Virginia; W. Kempster, Wisconsin; Jno. C. Hupp, West Virginia; Dr. Duvall, United States Navy; Dr. J. R. Smith, United States Army.

PREAMBLE AND RESOLUTION.

Dr. J. R. Bronson, of Massachusetts, offered the following preamble and resolution:

"*Whereas*, By the report of the Judicial Council submitted this day, we are informed that the Ethical Code of this Association is imperfect, in that it does not recognize by its letter a conceded violation of the spirit of our profession in its relation to irregular medicine; therefore,

"*Resolved*, That said Council be instructed to submit to this Association, at their next meeting, for its consideration, an amendment to the Code covering this omission."

The resolution was referred to the Judicial Council as a committee.

Dr. Foster Pratt, of Kalamazoo, Michigan, offered a resolution in relation to the legal status of the insane, which was referred to the Section on Medical Jurisprudence.

The Association then adjourned to meet on Thursday, June 6th, at 9.30 A.M.

WEDNESDAY EVENING.—SECOND DAY.

MORPHOLOGICAL CHANGES IN SYPHILITIC BLOOD.

In the Section on Practical Medicine,

DR. EPHRAIM CUTTER, of Boston, gave a microphotographic exhibition of the morphological changes which occurred in the blood in consequence of syphilis. The diagnosis of syphilis was based upon the presence in the blood of a *copper-colored* filiform growth with rounded and enlarged extremities and spores. Dr. Cutter regarded the demonstration as corroborative of the claims made by Dr. Salisbury in connection with the same subject.

He thoroughly believed that positive diagnosis of syphilis could be made by miscroscopical examination of the blood.

He also believed that Lostorfer was correct in his statement that the white blood-corpuscles were enlarged in syphilis; but he should have insisted upon the *copper color* of the spores.

THURSDAY, JUNE 6TH.—THIRD DAY.

The Association was called to order at 9.30 A.M. by the President.

The Secretary read the names of those who had registered since June 5th.

MEMBERS BY INVITATION.

DR. ROCHESTER, Chairman of the Committee of Arrangements, made the following report:

For members by invitation—Drs. Lawrence D. Trowbridge, of Niagara, N. Y.; Thomas McLean, of Goderich, Ont.; W. W. Potter, of Batavia, N. Y.; D. H. Kitchen, Superintendent of New York State Inebriate Asylum at Binghamton, N. Y.; H. R. Clark, Geneva, N. Y.; I. N. Goff, Cazenovia, N. Y.

A letter of regret from Dr. R. O. Howard, of Montreal, was read by the Secretary.

REPORT FROM THE JUDICIAL COUNCIL.

The Judicial Council reported that the charges against the Iowa State Medical Society, and Scott County Medical Society, presented by Dr. P. J. Farnsworth, were dismissed, because the subject had been already adjudicated by the Council at their Detroit meeting in 1874. They also reported that in the matter of the Washtenaw County Medical Society, it was decided that the Ann Arbor Society was entitled to two delegates to the present meeting.

DR. A. C. POST, of New York, moved that the first two on the list from the Ann Arbor Medical Society be received as delegates, the others remaining as members by invitation. Carried.

CONSOLIDATION OF SECTIONS.

DR. A. N. BELL, of Brooklyn, offered the following resolution, which was laid over until next year:

"*Resolved*, That Section Four, on Medical Jurisprudence and Psychology, and Section Five, on State Medicine and Public Hygiene, be consolidated into one Section as Section Four."

REPORT OF JUDICIAL COUNCIL AS A COMMITTEE.

DR. N. S. DAVIS, Chairman of the Judicial Council, presented the following report as an amendment to the Code of Ethics:

"In obedience to the instructions of this Association, the Judicial Council, acting in the capacity of a committee, have unanimously instructed me to report to your Honorable Body the following amendment and addition to paragraph 1, article 1. of the second division of the Code of Ethics, under the general heading, 'Of the Duties of Physicians to each other, and to the Profession at Large,' and the special heading, 'Duties for the Support of Professional Characters.' The same, when finally adopted, to be added at the end, and to constitute a part of said paragraph 1, of article 1. The proposed addition is in these words: 'And hence it is considered derogatory to the interests of the public, and the honor of the profession, for any physician or teacher to aid, in any way, the medical teaching or graduation of persons, knowing them to be supporters and intended practitioners of some irregular and exclusive system of medicine.'"

The report, under the rules, went over for one year.

REPORT OF THE COMMITTEE ON NECROLOGY.

DR. J. M. TONER, of Washington, Chairman, presented the report, which contained sketches of seventy-five members. He further remarked that there were 850 names now upon the list of necrology of the Association.

The report was referred to the Committee of Publication.

COMMITTEE ON NATIONAL LIBRARY.

The Secretary stated that the Committee on Catalogue of National Library was not prepared to report, and asked that the committee be continued. Granted.

ADDRESS OF DR. A. L. LOOMIS, OF NEW YORK, CHAIRMAN OF THE SECTION ON PRACTICAL MEDICINE, MATERIA MEDICA, AND PHYSIOLOGY.

DR. LOOMIS opened his address by making brief reference to a few of the more important advances in medicine which had been made during the past year, and then passed to the consideration of the *climatic treatment of pulmonary phthisis.*

With reference to the *germ theory* of disease it was believed that the facts as now presented did not warrant its acceptation.

With reference to the *etiology of typhoid fever* no new facts had been elicited regarding its spontaneous or specific origin.

The experiments of Heidenham had gone far to establish the fact that *croupous pneumonia had a specific* origin, and could not be excited by simple irritation of the respiratory passages.

Reference was made to Lancerot's description of a new form of diabetes, due to changes occurring in the pancreas.

Reference was also made to several new discoveries made in physiology. Among these, Dr. J. W. S. Arnold, of New York, had demonstrated by a series of experiments that the *first sound of the heart* had a muscular origin.

Mention was also made of several comparatively new therapeutic agents, such as jaborandi, hydrobromic acid, thymol, and the alkaloids used as a substitute for formic.

THE CLIMATIC TREATMENT OF PULMONARY PHTHISIS.

Dr. Loomis then passed to the consideration of the chief topic in his address, namely, some of the indications and considerations which should influence one in arriving at a decision with reference to the climate and locality best suited to each phthisical patient amenable to climatic treatment. [This portion of the address will be published in full in a subsequent number of THE RECORD.]

SANITARIUMS.

In order to obtain the greatest success in the climatic treatment of phthisis, it was necessary to have sanita-

riums under the direction of intelligent physicians, where patients could go and be free from all exciting causes of the disease. For the phthisical patient not the first step had yet been taken towards the proper construction and equipment of such resorts. Such sanitariums as could receive the endorsement and sanction of the leading medical men were needed in all parts of the country.

Dr. Loomis closed his address with the following practical suggestion:

OUR MINERAL SPRINGS.

"It seems to me that the necessities of our time are demanding the establishment not only of well-organized and thoroughly equipped sanitariums by the sea, in the mountains, in the cold regions of the North, and in the warm regions of the South, but that our mineral springs should be utilized for the cure of disease. No one doubts but they are equal, if not superior, to those of the old world; yet to-day we know more of the virtues of Carlsbad, Kissingen, Vichy, and Hunyadi waters than those of Saratoga, Virginia, Arkansas, and Colorado. Has not the time come, gentlemen, when some organized action should be taken in this matter?"

Dr. C. N. Palmer, of Lockport, moved that the address be referred to the Section on Practical Medicine. Carried.

Dr. Bowditch, of Boston, made a few remarks, and stated that in his experience for phthisical patients sanitaria upon the sea-shore were injurious.

Dr. James B. White, of Buffalo, offered the following resolution:

"*Resolved*, That a committee of five be appointed to confer with General Meyer upon the subject of making observations as to the existence of ozone in various localities, and take such other steps and measures in the matter as may be necessary for the success of the object."

In seconding the above, Dr. Davis, of Chicago, briefly stated what had already been done to attain the object by the profession since 1874. After a discussion by Drs. Busey, White, Bell, Bronson, Leonard, Loomis, and Davis, the resolution was adopted.

REPORT OF THE COMMITTEE ON NOMINATIONS.

Dr. Toner, Chairman of the Committee on Nominations, announced that they were ready to make their report.

Dr. Hupp, Secretary of the Committee, read the following, which, upon motion made by Dr. James P. White, of Buffalo, was accepted and unanimously adopted:

After due consideration the Committee on Nominations respectfully report that they have nominated the following gentlemen for the various offices named, to wit:

For President—Theophilus Parvin, M.D., of Indiana.

For Vice-Presidents—A. J. Fuller, M.D., of Maine; W. F. Westmoreland, M.D., of Georgia; John Morris, M.D., of Maryland; John H. Murphy, M.D., of Minnesota.

For Treasurer—Richard J. Dunglison, M.D., of Pennsylvania.

For Librarian—Wm. Lee, M.D., of District of Columbia.

Committee on Library—John Eliot, M.D., of District of Columbia.

Next place of meeting—Atlanta, Ga.

Time of meeting—The first Tuesday in May, 1879.

For Assistant Secretary—Scott Todd, M.D., of Atlanta, Ga.

Committee of Arrangements—J. P. Logan, Chairman; H. V. M. Miller, G. G. Crawford, H. L. Wilson, J. F. Alexander, J. M. Johnson, Charles Pinckney, V. H. Tallioferro, J. T. Johnson, of Atlanta, Ga.

Committee on Prize Essays—Robert Battey, of Rome, Ga.; J. G. Westmoreland, of Atlanta, Ga.; Wm. A. Love, of Atlanta, Ga.; Robert Kidley, of Atlanta, Ga.; Henry F. Campbell, of Augusta, Ga.; J. H. Van Deman, of Chattanooga, Tenn.

Committee on Publication—Dr. Wm. B. Atkinson, Chairman; T. M. Drysdale, M.D., A. Fricke, M.D., S. D. Gross, M.D., C. Wister, M.D., R. J. Dunglison, M.D., of Pennsylvania; and Wm. Lee, M.D., of District of Columbia.

The Committee also report the following nominations for Chairmen and Secretaries of Sections for 1879:

I. *Practice of Medicine, Materia Medica, and Physiology*—Dr. Thomas F. Rochester, of Buffalo, N. Y., Chairman; W. C. Glasgow, of St. Louis, Mo., Secretary.

II. *Obstetrics and Diseases of Women and Children*—E. S. Lewis, of New Orleans, Chairman; J. R. Chadwick, of Boston, Mass., Secretary.

III. *Surgery and Anatomy*—Moses Gunn, M.D., of Illinois, Chairman; Dr. J. R. Weist, of Indiana, Secretary.

IV. *Medical Jurisprudence, Chemistry, and Psychology*—Dr. Wm. M. Compton, of Mississippi, Chairman; L. M. Eastman, of Maryland, Secretary.

V. *State Medicine and Public Hygiene*—Dr. John S. Billings, of District of Columbia, Chairman; Dr. J. T. Reeve, of Wisconsin, Secretary; Alabama, Jerome Cochran; Arkansas, W. B. Welsh; California, W. F. Cheeny; Colorado, C. Dennison; Connecticut, C. A. Lindsley; Delaware, Wm. Marshall; District of Columbia, T. Antisell; Georgia, J. W. Bailey; Illinois, H. A. Johnson; Indiana, James F. Hibbard; Iowa, J. A. Blanchard; Kansas, D. W. Stormont; Kentucky, S. Brandeis; Louisiana, Sanford E. Chaillé; Maine, A. P. Snow; Maryland, T. B. Evans; Massachusetts, H. I. Bowditch; Michigan, H. B. Baker; Minnesota, C. P. Adams; Mississippi, Wort Johnson; Missouri, Jacob Geiger; New Hampshire, G. P. Conn; New Jersey, E. M. Hunt; New York, A. N. Bell; Ohio, J. C. Reeve; Pennsylvania, Benjamin Lee; Rhode Island, E. M. Snow; South Carolina, R. A. Kinlock; Tennessee, T. A. Achesón; Texas, H. W. Brown; Virginia, F. D. Cunningham; Vermont, L. C. Butler; West Virginia, E. A. Hildreth; Wisconsin, J. T. Reeve; Florida, G. W. Betton; North Carolina, C. J. O'Hagen; United States Army, Joseph Smith, of Fortress Monroe; United States Navy, Joseph Wilson, of Washington, D. C.; Oregon, H. Carpenter.

Committee on Necrology—J. M. Toner, M.D., of the District of Columbia, Chairman; Alabama, J. S. Weatherby; Arkansas, R. G. Jennings; California, Henry Gibbons; Colorado, R. G. Buckingham; Connecticut, G. W. Russell; Delaware, L. P. Buck; District of Columbia, W. W. Johnson; Georgia, T. S. Hopkins; Illinois, J. H. Hollister; Indiana, John Moffit; Iowa, C. C. Bradley; Kentucky, L. P. Yandell; Maine, E. F. Sanger; Massachusetts, J. R. Bronson; Maryland, J. H. Hartman; Michigan, W. F. Breakley; Minnesota, C. C. Cross; Missouri, A. J. Steele; New Jersey, John Blaine; North Carolina, N. J. Pitman; Louisiana, Samuel Logan; New York, J. P. Gray; Ohio, Thad. H. Reamy; Oregon, — ——; Pennsylvania, Thomas H. Helsby; Rhode Island, C. H. Fisher; South Carolina, Manning Simmons; Tennessee, Thomas Menees; Texas, J. H. Stalnaker; Virginia, L. S. Joynes; Wisconsin, D. Mason;

Vermont, O. F. Fassett; Mississippi, P. F. Whitehead; Kansas, C. V. Mattram; New Hampshire, L. G. Hill; West Virginia, Robert W. Hazlett; United States Army, J. J. Woodward, of Washington, D. C.; United States Navy, Joseph Wilson, of Washington, D. C.; Nebraska, J. H. Peabody.

Judicial Council—To fill a vacancy caused by death, John P. Gray, of Utica, N. Y.; in place of the seven whose terms expire at this meeting, D. A. Linthicum, of Arkansas; Foster Pratt, of Michigan; A. Woodward, of Connecticut; J. M. Toner, of District of Columbia; J. H. Van Deman, of Tennessee; S. M. Benham, of Pennsylvania; R. N. Todd, of Indiana.

REPORT ON RECOMMENDATIONS IN EX-PRESIDENT BOWDITCH'S ADDRESS.

DR. N. S. DAVIS, Chairman of the Committee, made a somewhat lengthy report, and closed as follows:

"After a careful review of the whole subject, indeed by many years of careful observation in the Sections of the Association, the undersigned would recommend no change in the present by-laws and ordinances regulating the working of the Sections, except the striking out of the paragraph in Section 11 of the by-laws, commencing with 'Papers appropriate to the several Sections,' etc., and inserting in its place the following:

"'It shall be the duty of every member of the Association, who proposes to present a paper or report to any one of the Sections, to either forward the paper, or a title indicative of its contents and its length, to the Chairman of the Committee of Arrangements at least one month before the annual meeting at which the paper or report is to be read. It shall also be the duty of the President and Secretary of each Section to communicate the same information to the Chairman of the Committee of Arrangements concerning such papers and reports as may come into their possession or knowledge for their respective Sections the same length of time before the annual meeting. And the Committee of Arrangements shall determine the order of reading or presentation of all such papers, and announce the same in the form of a programme for the use of all members attending the annual meeting. Such programme shall also contain the rules specified in the by-laws and ordinances concerning the consideration and disposal of all papers in the Sections.'

"All of which is respectfully submitted.

N. S. DAVIS,
S. D. GROSS."

DR. BOWDITCH presented the following *minority report:*

"The undersigned still holds to the opinion that the submission to trained experts of all papers read or presented to the various Sections of the Association would tend to make our published Transactions more interesting, and vastly to increase their scientific merits, although perchance making them less bulky.

"He believes, moreover, that some other of the amendments suggested by him would ultimately be of service to the Association.

"He admits the cogency of the arguments of the majority of the committee in regard to permanent membership.

"He still adheres to the idea that the time spent in discussions in regard to the by-laws in any scientific body is commonly so much time wasted, which should be spent in more congenial and appropriate work, and that no changes, even though deemed very important by a few, should be made in the organic law, if they do not meet with favor with a large majority of the body.

"And, finally, in full confidence that with our present by laws, if the Chairmen and Secretaries of the Sections and of the Committee of Arrangements will do thoroughly their respective duty, the meetings of this Association and its transactions will annually grow better, as they have done in the past, the undersigned will not oppose the report of the majority of the committee. HENRY I. BOWDITCH."

The majority report was unanimously adopted.

STATE MEDICINE AND PUBLIC HYGIENE.

DR. J. L. CABELL, of the University of Virginia, Chairman of the Section, delivered an address, in which he maintained that the establishment of a general Board of Health was the indispensable measure to any systematic effort to inaugurate State medicine in any of the States of the Federal Union.

As to the value of sanitation in general in diminishing the death-rate, reference was made to the address of Mr. Edwin Chadwick, delivered before the British Social Science Association at Aberdeen, September 13, 1877.

Speaking with reference to the maintenance of the purity of the air within and around dwellings, Dr. Cabell remarked that the evidence of advance in public hygiene consisted not so much in the discovery of new facts or principles, as in more careful, exact, and honest methods of sanitary engineering, in conformity with well-known laws of sanitary science. It could scarcely need be said that one of the most fruitful sources of the impurity of the air around dwellings, and consequently of the air within dwellings, since the latter was constantly being replaced by the former, was the damp condition of the ground, which, however well drained of subsoil water at first, was liable to subsequent contamination with liquid filth, whether arising from slops thrown upon the surface of yards or gardens, or from the dejections of animals. A soil well aerated by proper water-drainage, would, in a measure at least, oxidize the organic matters, and mitigate the generation of malaria. It would not, however, be safe to rely upon that to disinfect the excrement-sodden soil in the streets of cities, and it became an important problem of sanitary engineering how to protect the atmosphere of cities from that source of contamination. That end could probably be secured by the best asphalt pavements, such as had been largely used in some of the cities of Europe, and had been successfully introduced in some parts of Brooklyn, and on the principal avenues of the national metropolis. No water or filth could penetrate them, and they were easily cleaned at less expense than any other pavement. A necessary condition, however, of the beneficial action of impervious pavements was the absolute freedom of the subsoil from the contamination which might arise from defective sewers, or from percolation of the contents of cesspools.

Reference was then made to what had been accomplished by sanitary measures in preventing the spread of contagious diseases, and from that point Dr. Cabell proceeded to discuss at considerable length the theory of *contagium vivum*.

The address was referred to the Section on State Medicine and Public Hygiene.

QUESTION OF PRIVILEGE—SHORTENING IN FRACTURES.

DR. LEWIS A. SAYRE, of New York, rose to a question of privilege, and asked that he be recorded upon the minutes as opposed to the passage of the resolution, adopted by the Association at its meeting held in Chicago in 1877, relating to the occurrence of shortening in fracture of long bones.

The purport of the resolution was that shortening was the rule, in spite of all treatment, and he wished to be recorded as opposed to the doctrine that fractures could not be treated without such result.

The request was granted.

The Association then adjourned to meet on Friday, at 9.30 A.M.

FRIDAY, JUNE 7TH.—FOURTH DAY.

The Association was called to order at 9.30 A.M. by the President, Dr. Richardson.

COMMITTEE ON OZONE.

Pursuant to resolution offered by Dr. White in yesterday's session, the President announced the Committee on Ozone as follows: Dr. N. S. Davis, of Illinois, Chairman; Dr. J. S. Billings, of United States Army; Dr. W. N. Geddings, of South Carolina; Dr. J. M. Toner, of the District of Columbia, and Dr. S. M. Bemis, of Louisiana.

MEMBERS BY INVITATION.

DR. ROCHESTER, Chairman of the Committee of Arrangements, announced the following as members by invitation: Drs. W. J. A. Case, of Hamilton, Ont.; George N. Burrell, of Brigham Hall, Canandaigua; George Waters, of Coberg, Ont.; H. C. Hill, of Lockport, N. Y.; V. A. Ellsworth, of East Otto, N. Y.; A. A. Hubble, of Leon, N. Y.; John W. Whitbeck, of Rochester, N. Y.; Milan Baker, of Warsaw, N. Y.

The Secretary read a letter of regret from Dr. George E Fenwich, of Montreal, which was ordered on the minutes.

DUTY OF THE COMMITTEE ON NECROLOGY.

The following resolution was offered by Dr. J. S. HIBBARD, of Indiana:

"*Resolved*, That hereafter it shall be the duty of the Committee on Necrology to confine their reports to the death of medical men who have been members of this Association, and at the time of death were still in good fellowship or honorably separated from the Association." Adopted.

ORGANIZATION OF STATE BOARDS OF HEALTH.

DR. A. N. BELL, of Garden City, moved the continuance of the committees appointed two years ago for the organization of State Boards of Health. Carried.

METRIC SYSTEM—COMMUNICATION FROM THE MEDICAL SOCIETY OF THE STATE OF PENNSYLVANIA.

The following communication from the Medical Society of the State of Pennsylvania was read by the Secretary:

"At the annual meeting of this body held in Pittsburg, May, 1878, it was unanimously

"*Resolved*, That the Medical Society of the State of Pennsylvania, recognizing the advantages of the metric system from its universality, simplicity, and scientific character, does recommend the use of the same to the members of this Society, and urges them to familiarize themselves with it, and to advise their students to use it exclusively when they commence their medical career.

"*Resolved*, That in all communications made to this Society, in which reference is made to weights and measures, the metric system only should be used.

"*Resolved*, That the Secretary of this Society is instructed to bring this action of this Society to the notice of the American Medical Association at its next meeting, and urge upon the National Association a similar action."

On motion by Dr. Atkinson, and seconded by Dr. N. S. Davis, the communication was received and placed upon the minutes.

MEDICAL UNIFORMITY—COMMISSIONERS AND DELEGATES TO EUROPE.

On motion, Drs. Marion Sims, Thomas Drysdale, and E. Seguin, were confirmed as delegates to Europe, upon the question of medical uniformity, to report next year.

COMMITTEE ON THE ADDRESS OF THE CHAIRMAN OF THE SECTION ON PRACTICAL MEDICINE.

DR. N. S. DAVIS, of Chicago, offered the following resolution, which was adopted:

"*Resolved*, That the Section on Practical Medicine, Materia Medica, and Physiology recommend the appointment by the American Medical Association of a committee of five members, to whom shall be referred so much of the recommendations in the address of the President of that Section as relates to the establishment of proper sanitaria for consumption, and the more accurate utilizing of the various mineral waters of our country, with instructions to report at the next meeting of the Association."

The President appointed the following members as such committee: Dr. H. I. Bowditch, of Massachusetts; Dr. A. N. Bell, of New York State; Dr. J. L. Cabell, of Virginia; Dr. S. E. Chaillé, of Louisiana; and Dr. Charles Dennison, of Colorado.

DELEGATES TO FOREIGN SOCIETIES.

The President announced the following delegates: *To European Medical Societies*—Drs. Sims, Drysdale, Seguin, Daly, Halberstadt, Levis, and W. H. Pancoast. *To the Canadian Medical Association*—Drs. Brodie, Todd, E. N. Brush, and W. Clarke.

LEGAL RELATIONS OF THE INSANE.

The following resolutions concerning certain legal relations of the insane, offered by Dr. Foster Pratt, of Michigan, in Section V., and referred to the Association, were received and adopted:

"*Resolved*, That the personal restraint of the insane is an essential element of the medical treatment of their disease, the use of which, as a therapeutical agency, may be justified by their insanity, just as the use of it as a public agency, for the prevention of injury to person or property, is justified by their dangerous conduct.

"*Resolved*, That while none question the necessity for specific statutory provisions to regulate the restraint of those insane persons who are wholly or partly a public charge, we maintain

"That it is the duty of relations and friends, and it is also their natural and inherent right, whether declared or understood by statute, to retain and to care for their sick or insane relations as a private patient at his or their expense, in his or their home, or in a legally recognized and regulated hospital; and

"That the exercise, by them, of so much restraint as is essential to their proper treatment of his disease is not a violation of his rights of personal liberty; and

"That their duty and right to exercise such remedial restraint are subject to State surveillance or legal limitations only so far as may be necessary to prevent their neglect of that duty or to punish their abuse of the right."

REPORT OF COMMITTEE APPOINTED TO SECURE THE FORMATION OF STATE BOARDS OF HEALTH.

"Your committee, consisting of the President and Permanent Secretary, who are required to report annually the results of their efforts for the organization of State Boards of Health, respectfully report that they have addressed the Governor of each State where a Board of Health has not been organized with a suitable memorial. A few Executives have courteously acknowledged this communication and expressed their earnest desire to further our efforts. We are happy to announce that three additional State Boards have been organized, making nineteen in all, viz.: Alabama, California, Colorado, Connecticut, Georgia, Illinois, Kentucky, Louisiana, Massachusetts, Maryland, Michigan, Minnesota, Mississippi, New Jersey, North Carolina, Tennessee, Rhode Island, Virginia, Wisconsin." Adopted.

NEW SECTION.

DR. X. C. SCOTT, of Ohio, called up the resolution of last year, creating a new Section of Ophthalmology, Otology, and Laryngology, to be known as Section VI., and moved its adoption. Carried.

On motion of Dr. E. SMITH, of Detroit, Dr. H. Knapp, of New York, was made Chairman of the new Section, and X. C. Scott, of Ohio, was made Secretary.

ADDRESS OF DR. WALTER KEMPSTER, OF OSHKOSH, WISCONSIN, CHAIRMAN OF THE SECTION ON MEDICAL JURISPRUDENCE, CHEMISTRY, AND PSYCHOLOGY.

DR. KEMPSTER first considered the pathological brain lesions characteristic of insanity. The blood-vessels were changed in appearance, the morbid process beginning in the walls of the capillaries. Miliary aneurisms occurred, and as they ruptured speedily became the centres for changes in the brain tissue. The interstitial tissue of the brain was also affected, and changes were also found in the nerve-cells in the way of hypertrophy, atrophy, nucleus becoming diseased. There was also change in the substance of the cell. The cell changes might be so extensive that in the place of nerve-cells there were seen masses of granular material having no relation whatever to the appearance of a normal cell. With reference to the membranes of the brain, Dr. Kempster thought that they were quite uniformly found affected in all cases of insanity, and that there existed adhesions between the membranes and the brain, especially over its anterior portions, thus affecting the motor centres. Absence of such adhesions at the posterior part of the brain was a noticeable feature.

The question of

LOCALIZATION OF FUNCTIONS

was discussed at some length, and the cases reported by Charcot, E. C. Seguin, and others were referred to as evidence of the correctness of the doctrine. Reference was also made to the teachings of Brown-Séquard and Schiff in opposition to the theory of localization of functions. Dr. Kempster believed that the weight of accumulative testimony went to show that the localization doctrine was correct.

Reference was made to a case of

TEMPORARY AND TRANSIENT APHASIA

which had fallen under his observation. It was believed to be due to cerebral anæmia.

Special mention was made of two cases in which convulsions could be produced by pinching the dura with a pair of forceps through an opening made in the skull by a fracture.

In the department of

MEDICAL JURISPRUDENCE

nothing had occurred during the past year worthy of special mention, unless it was that Wisconsin lawyers and a judge had recognized the fact that the "knowledge test" was unreliable.

DR. KEMPSTER expressed the hope that the time would come when the *court* would call expert testimony, if the obscurity of the case seemed to make it necessary.

The address was referred to the Committee on Publication.

TREASURER'S REPORT.

DR. RICHARD J. DUNGLISON, Treasurer, reported as follows:

"The Treasurer has the honor to report a balance in the treasury at the end of the fiscal year of $2,446.02. This amount is much larger than would have been found there had any deduction been made to pay the Permanent Secretary an honorarium for his services for the previous year. For the first time for a number of years the Association at its last meeting omitted to pass a resolution appropiating money to this end, and the Treasurer was thus left without authority to devote the funds of the Association to such a purpose. The annual amount, whatever it might be, voted by that body to its Secretary, was an honorarium, and not a salary, the Association having decided in 1873, upon the adverse reports of a committee appointed in 1872 to decide upon the propriety of making the office a salaried one, that 'no amount of specified salary be attached to the office.' Ever since that time an honorarium, not a salary, has been paid him by the Treasurer, but never without the authoritative order of the Association, as conveyed by annual resolution.

"The Treasurer is in constant receipt of applications from members for volumes of the Transactions of the Association which are entirely out of print. As some of the members are in possession of scarce volumes, which they may not wish to retain, the Treasurer will willingly act as a medium of exchange, and thus accommodate those who are anxious to complete their sets." [Here followed a financial statement.]

The report was adopted and referred to the Publication Committee.

The annual report of the Publication Committee was received and adopted.

HONORARIUM TO THE PERMANENT SECRETARY.

DR. N. S. DAVIS, of Chicago, moved that the Treasurer be authorized to draw his warrant and pay to the Permanent Secretary the sum of $700 as an honorarium for the faithful performance of his duties. Carried.

REPORT OF COMMITTEE ON PRIZE ESSAYS.

"Your committee to determine the merits of prize essays would respectfully report: That they have had three separate papers submitted to their inspection. Two of these papers present subjects of very great interest, and show original researches, but are too imperfect, in the estimation of the committee, to command a prize. The remaining paper, in the judgment of your committee, is fully up to the requirements. Indeed, the paper is so elaborate as to fill a large space in the volume of the Transactions of the Association. The paper should be considered as *two* and not as *one*. The analysis of 789 cases of operation on the carotid

artery, and the careful and minute measurements of the artery and its branches in one hundred and twenty-one subjects, showing the range of variation and the percentage of the same, followed by inferences bold and original, naturally constitutes a paper complete in itself. Another one on the same plan with reference to the innominate and subclavian, being an analysis of 300 cases, and the observation of fifty-two subjects, is presented to us in such a manner, that we may consider the whole as one prize, or they may compete for both.

"Your committee believe that both prizes should be awarded to the two essays by one person. The motto is, 'Tempora mutantur et nos mutamur in illis.'

E. M. MOORE, Chairman;
THOS. LOTHROP,
H. R. HOPKINS,
W. W. MINER."

The recommendation of the committee was unanimously adopted.

On opening the sealed envelope the name of the successful essayist was found to be DR. JOHN A. WYETH, of New York City.

THE LIBRARIAN'S REPORT

was read and referred to the Committee on Library.

On motion made by DR. BRODIE, of Detroit, the Treasurer was authorized to pay to the Librarian the sum of two hundred dollars, to be used by him according to the recommendation contained in his report—namely, for binding pamphlets and loose papers.

On motion of DR. DAVIS, of Chicago, the recommendation of the Librarian adding Dr. J. M. Toner, of Washington, to the Library Committee, was adopted.

DR. J. M. KELLER, of Arkansas, offered the following, which was laid over for one year:

"*Resolved*, That in future the Committee on Nominations shall present the name of no person for appointment or election to office or position, save on the Committees on Necrology and Climatology, unless the party nominated be in attendance on the Association at the time."

PROPOSED NEW SECTIONS.

DR. J. J. CALDWELL, of Maryland, offered a resolution creating a new Section upon "Neurology and Electrology." Action deferred for one year.

DR. MADDOX, of Baltimore, Md., offered a resolution creating a Section on "Diseases of the Genito-Urinary Organs, including Dermatology and Syphilis." Action deferred for one year.

IN MEMORIAM.

DR. J. M. TONER, of Washington, offered the following preamble and resolutions, which were adopted:

"*Whereas*, A short time previous to the meeting of this Association, Professor Joseph Henry, late Secretary of the Smithsonian Institute, departed this life full of years and honors; therefore, be it

"*Resolved*, That the American Medical Association hereby offers its tribute of respect to the name of this illustrious man, whose pure and noble life, as well as his great attainments and actual discoveries, have long since placed him at the head of the men of science in this land.

"*Resolved*, That while we share the common grief of all his fellow-countrymen on the occasion of his death, we believe his name will be established in the memory of posterity, and we hold up his example for the emulation of all lovers of the truth, now and hereafter.

"*Resolved*, That a copy of these resolutions be transmitted to the Regents of the Smithsonian Institute and to the family of the deceased."

AMENDMENTS TO THE BY-LAWS.

DR. DAVIS, of Chicago, offered a resolution with reference to the following amendments proposed by him last year, which was adopted:

"Strike out all of third paragraph, Section VIII.: 'It shall be the duty of every member of this Association, who learns that any existing medical school departs from the published conditions of graduation, to report the fact at the annual meetings; and, on proof of the fact, such school shall be deprived of its representation in this body.'

"Strike out all of second paragraph, Section IX.: 'This Association recognizes as a "regular organized" medical college one that has been represented at any meeting, and that complies with the rules and directions found in the published *Transactions*, vol. xiii., page 38.'"

DR. HITCHCOCK, of Michigan, offered an amendment to the by-laws with reference to the nomination of officers.

Laid over for one year.

DR. RICHARDSON, with complimentary remarks, then introduced Dr. PARVIN, the President-elect, who, in most eloquent and appropriate words, addressed the Association and returned thanks for the high honor it had conferred upon him.

DR. J. H. VAN DEMAN, of Tennessee, offered resolutions, which were unanimously adopted, expressive of the appreciation of the hospitalities and courtesies extended to the members of the Association by the medical profession and the citizens of Buffalo, and also thanking the officers of the Association for the promptness with which they had discharged their several duties.

On motion, the President declared the Association adjourned, to meet in Atlanta, Ga., on the first Tuesday in May, 1879.

NEW YORK MEDICAL JOURNAL ASSOCIATION.

Special Meeting, May 24, 1878.

DR. ROBERT F. WEIR, PRESIDENT, IN THE CHAIR.

THE RATIONAL TREATMENT OF STRICTURE OF THE MALE URETHRA.

DR. S. W. GROSS, of Philadelphia, on invitation, read a paper upon the above subject, which is published in full in the present number of THE RECORD. [See p. 461.]

The paper being before the Association for discussion,

DR. J. W. S. GOULEY remarked that he could endorse a majority of the statements made by Dr. Gross, but that there were some upon which he wished to make a few remarks.

TREATMENT BY GRADUAL DILATATION.

First, with reference to gradual dilatation, which Dr. Gross had rejected entirely as a method of cure. In order to speak intelligently upon the treatment of stricture of the male urethra, it was necessary to come to some understanding with reference to classification. If strictures were divided into two general classes—1. Idiopathic, such as resulted from some form of urethritis, and 2. Traumatic—it would be found that the two varieties demanded somewhat different methods of treatment. Again, with reference to idiopathic

strictures, *permeability* and *impermeability* by means of instruments varied the treatment.

The *situation* of the stricture also varied the treatment, and those which occurred in the deep portions of the urethra demanded a different method from those which were situated in the pendulous portion of the organ.

TREATMENT OF DEEP-SEATED STRICTURES.

With reference to deep-seated idiopathic stricture. Dr. Gouley preferred to adhere to the old plan of treatment by gradual dilatation. Strictures of recent formation were amenable to that plan of treatment, and even old and indurated strictures, he firmly believed, should be *first* treated by gradual dilatation. He thought that the cutting operations should not be made until gradual dilatation had been thoroughly tested.

The stricture should be dilated to the *fullest* capacity of the portion of the urethra in its immediate vicinity. In ascertaining the capacity of the urethra it should be *fully distended*, and then dilatation of the stricture should be gradually carried up to that point. It was of trifling importance as to what method was employed; whatsoever instrument would effect the object was acceptable.

It had been suggested to Dr. Gouley by a Russian army surgeon, Wywodzoff, that when dilatation was carried to that extent there was really a rupture of stricture tissue; that in reality the stricture was *divulsed*. Dr. Gouley thought it possible that such was the case, but whatever might be the facts with reference to that point, he had had cases under observation in which recontraction had not occurred at the end of ten or twelve years after complete distention had been made, and maintained for one or two years. He should therefore continue to believe in gradual dilatation as a *means of cure* for stricture of the urethra until he had more convincing proof of its futility than had yet been offered.

DR. GROSS—Did I understand Dr. Gouley to say that dilatation is to be limited by the size of the meatus?

DR. GOULEY replied that with his own instrument he was able to overdistend the urethra at the seat of the stricture without in any way disturbing the meatus; and that he never interfered with the meatus except there were special indications for its division.

DIVULSION OF THE URETHRA.

With reference to *divulsion* Dr. Gouley agreed substantially with the views expressed by Dr. Gross.

Divulsion was a *good* operation for those strictures, even though indurated, which were situated in the perineal portion of the urethra, but it was a *bad* operation when applied to those strictures which were situated between the posterior extremity of the fossa navicularis and the peno-scrotal junction. Free divulsion of stricture in the fixed portion of the urethra, had, with him, as well as others, been a successful operation. He preferred that it should not be done, as a rule, with a double-bladed divulsor. His method had been, in cases of narrow stricture, to introduce a filiform bougie into the bladder, pass over it a tunnelled sound—the smallest, perhaps—and then follow with a larger and larger instrument until No. 14 or 15 was reached, and then with an ordinary sound carry the divulsion as far as might be done with the instruments at hand. Of course, in such an operation, the meatus was to be divided if it interfered with the introduction of instruments. Then, following the example of Reybard, he employed a urethral expander and carried divulsion up to the point desired. The important point in the operation was to make the urethra four or five numbers larger than the natural size at the seat of, stricture, in order to allow for the subsequent contraction which would take place in the course of one or two years. In that manner he had performed divulsion in something over 300 cases by simply wedging in conical sounds one after another. He thought it was unnecessary to make an enormous rent; a number of small rents in the cicatricial tissue was more in the aggregate than a single large one.

INTERNAL URETHROTOMY.

Under what circumstances was internal urethrotomy to be performed? Dr. Gouley believed that in some cases a great deal of good could be done by the operation; but, although a great deal of good could be done, a more than corresponding amount of harm had been done by its improper use. Unfortunately, Reybard, who had cut the urethra so extensively, had entirely too many followers, both in this country and in England. Dr. Gouley had seen cases in which the urethra had in reality been destroyed, throughout its entire length, by internal cutting operations. By such repeated cutting operations the spongy tissue of the urethra was blocked up with new interstitial tissue, and became like an old india-rubber tube which had lost its contractility and distensibility. For those strictures situated in the pendulous portion of the urethra, internal urethrotomy was an excellent operation; but for strictures situated in the deeper part of the canal it was usually unnecessary.

In his entire experience, commencing in 1851, he had performed internal urethrotomy in *not to exceed* forty-three cases, and of that comparatively small number he boasted, while there were many young men in the profession who had performed it a much greater number of times.

With reference to the manner of making the incision, that from behind forward, in cases of permeable stricture, was a most excellent method, but in very narrow strictures it is necessary to incise from before backwards. With regard to the instruments to be employed, he favored Maisonneuve's urethrotome, or any of its modifications, for the anterograde, and Civiale's, or any of its modifications, for the retrograde operations.

In reply to questions from Dr. Gross, Dr. Gouley said that the object of divulsion was the same as that of internal urethrotomy, but that he preferred it to internal urethrotomy because the latter was a much more dangerous operation.

DR. GROSS.—Do you think divulsion restores the calibre of the urethra as readily as does internal urethrotomy?

DR. GOULEY said that he believed it did, and that divulsion had given him better results than he had obtained by internal urethrotomy in the treatment of strictures in the deeper portion of the urethra.

What he had termed the "cicatricial splice" was provided for equally as well, but when formed it must be kept a little larger than the other portions of the canal.

DR. GROSS remarked that he was unable to understand how the "cicatricial splice" in the deeper portions could be better provided for than by internal urethrotomy

DR. GOULEY remarked that he did not think it could be *better* made by divulsion than by internal urethrotomy, but that divulsion was a much safer and more easily performed operation, and one which in his hands had yielded more favorable results.

With reference to dividing the meatus, he regarded

it as an unnecessary operation when it held a normal relation to the posterior portion of the urethral canal.

Dr. Otis remarked that he was glad to find himself thoroughly in accord with Dr. Gross on nearly all important points. In answer to a direct question by Dr. Gross, with reference to the normal calibre of the meatus urinarius, he would say that he was opposed to all *standards* of measurement for the meatus and the urethra. Because the *average* size of the meatus was twenty-four or twenty-two millimetres, it should not be taken as a *basis* for operations. No average should ever take the place of exact individual measurements for either meatus or urethra. In regard to the statement that a narrow meatus was required to increase the projectile power of the urethra, he would say that the urethra was simply a conducting tube from the bladder to carry the urine to a convenient distance, and not for the *competitive* projection of urine. In its normal condition the urine passed through it, and was thrown to a proper distance. He had repeatedly divided the meatus, as far as could be done without making a hypospadias, and yet the urine was expelled with considerable force quite three feet. Practically, he believed it to be a very great mistake to regard the average circumference of the meatus as a guide to the calibre of any urethra. It had been found, through the repeated observations of Prof. Thos. R. Brown, of Baltimore, and others, that in the fœtus, and in the new-born child, there was no such thing as a fossa navicularis, but that the urethra was of uniform size from the bulbous enlargement down to the orifice, unless distended through the influence of a contracted meatus. With reference to dividing the meatus urinarius, cases were frequently met with in which it was so small that division became necessary, and such division was a recognized necessity by those who did not approve of cutting operations. Every surgeon had met with such cases more or less frequently, and had not hesitated to divide the meatus when it was narrowed so as to interfere with the proper treatment of the canal behind it. There occurred, also, various reflex disturbances of grave character as a consequence of contracted meatus urinarius. Division of the contractions under such circumstances became a necessity before cure of the reflex phenomena could be effected. Sir Henry Thompson had merely mentioned the fact that certain obscure urinary troubles, which had existed for a long time, had been cured by division of the meatus urinarius, but Dr. Otis was the first, in late years, to direct special attention to this fact and report cases. He supposed that it was original with himself until a recent thorough study of Civiale's writings revealed the fact that he (Civiale) had, in his *Traité Pratique des Maladies Genito-urinaires*, 1843, called attention to the point, and had thus anticipated Dr. Otis in every respect. Dr. Otis believed that he was the first to exhume those important observations, which had quite dropped out of the literature of the profession, and which so fully confirmed his own published experience. Civiale had spoken of contraction of the meatus urinarius as a cause of profound disease of the genito-urinary apparatus. He had recognized it as a cause of neuralgia of the testicle, cystitis, orchitis, etc., etc., and Dr. Otis maintained that it was for the cure of such cases the meatus urinarius should be divided until its calibre equalled that of the canal behind it. In many cases the reflex irritation from a contracted meatus was such that it became necessary to divide the meatus until its calibre was equal with that of the fossa navicularis before the irritation would cease.

Again, Dr. Otis divided the meatus in cases of gleet. He had found it necessary to make the orifice so free that irritating fluids could not be retained at that point, and thus keep up the gleet indefinitely. In most cases, if the meatus was kept free so that no irritating fluids could be retained in the urethra, the formation of strictures would often be avoided, and it was at that point that he would begin the "rational treatment" of stricture. The *rational* treatment consisted *in guarding against its formation*, and he believed that the time would arrive when close strictures would be considered an opprobrium of surgery. It was a well-known fact that urethral stricture occurred as a direct consequence of gonorrhœa, and yet this fact seemed to be lost sight of in practice. Surgeons treated a gonorrhœa during its continuance, and dismissed the patient in complete ignorance that in all probability the foundation of strictures, more or less numerous, had been laid. In a few months, perhaps years, a gleet made its appearance—the legitimate result of a stricture already formed—and still no warning was given. An injection was prescribed or a copaiba mixture, and the stricture left to go on contracting until finally retention of urine occurred, and the patient was coolly told that he had a stricture, which possibly had already done serious damage to bladder or kidneys, or both. Dr. Otis regarded it as the fault of the surgeon that stricture in such cases should be permitted to occur without warning or treatment, and especially so, as discovery of incipient stricture was easy, and its removal rapid, almost painless, without danger. When stricture of the urethra had occurred, Dr. Otis believed that it was decidedly the best treatment, instead of waiting for serious trouble, to restore the calibre of the canal to its natural size as soon as possible by the operation of internal urethrotomy.

He regarded it as a matter of great importance whether or not the patient was obliged to visit the office of his physician once or twice a week for several years, and then go away with the expectation of returning for further treatment. The stricture was composed of contractile tissue; it did contract; its tendency was always to contract, in spite of bougies and sounds; and the best treatment for such tissue was division with the knife. His experience had varied somewhat from that of some, in the fact that his operations had not been followed by disastrous results. For, out of 600 operations in about 400 cases, he had not seen a single fatal result, and *the strictures had disappeared in every instance where the division had been complete.* Of these cases there were about fifty in which the operation was performed from one to seven years ago, and up to the present time, as far as he was able to ascertain, they had remained free from all recontraction.

Dr. E. L. Keyes believed that the urethra should not be explored for stricture until some symptoms made it necessary. The first principle laid down by Dr. Gross, namely, that in cases of stricture of the urethra the expansibility of the canal should be restored, Dr. Keyes regarded as undoubtedly an axiom, because symptoms generally did not yield until that had been effected. When stricture produced symptoms, he would proceed to remove them by gradual dilatation with conoidal steel instruments. The size to which the urethra should be brought, he regarded as a matter not of paramount importance so long as the symptoms were removed. He believed gradual dilatation to be an effective method of treatment, because he had had many cases under observation in which by that method symptoms had been relieved, and had not returned.

Again, *the safety* of an operation was a question of great importance. If a man could be cured of a slight gleet by dilating the urethra, why not cure him by that method rather than submit him to a more dangerous one? So far as inconvenience to patients was concerned, in the frequent passage of an instrument, there were but few who could not quickly learn to use the sound, and thus the objection to the method of treatment, because it necessitated too frequent visits to the surgeon, was overcome.

Dr. Keyes did not disapprove of internal urethrotomy, but he did not favor it as a *substitute* for other methods; he regarded it simply as an adjuvant to other methods, and one which could be resorted to for the relief of certain conditions of the stricture, such as resiliancy and special undilatable nature of strictures found very far forward in the canal.

But the operation should be employed preferably for the strictures situated in the anterior portion of the canal, as hemorrhage, if it occurred, could then be easily controlled. When serious hemorrhage occurred after the cutting operation in the deeper portions of the urethra, it could not be readily controlled, and that fact was an important objection to the performance of the cutting operation in those parts.

When, therefore, gradual dilatation was not applicable to close stricture in the deeper portion of the urethra, he resorted to *divulsion*.

With reference to the meatus there was no reason whatever for cutting it, unless such an operation became a necessity in order to afford relief from symptoms, or for the management of strictures lower down. If the symptoms did not cease, and especially if a small pocket was found in the skin, the meatus by all means should be slit.

Dr. Keyes recognized it as a fact that there were certain strictures which were not removed by any amount of cutting. As evidence, cases were cited in which he had cut the urethra until it admitted 42 French, and yet 40 bulb detected rib-like prominences in the cut portion of the canal.

He believed, finally, that in case of *tight stricture deep in the canal*, a necessity for the occasional use of a dilating instrument indefinitely in the future existed in a majority of cases after any form of treatment whatsoever, external or internal urethrotomy, divulsion, or dilatation. But he was certain, also, that occasional permanent cures were effected in that region by each of the methods, and was confident that gradual dilatation was the safest and the best. Making positive rules for the whole canal by the results obtained in treating strictures of large calibre in the anterior section, he believed was begging the question.

Dr. Weir thought that, when speaking of the treatment of stricture of the urethra, a distinction should be made according to the portion of the canal in which the contraction was situated. He did not believe that it had yet been proved that internal urethrotomy was a better operation than gradual dilatation, so far as ultimate results were concerned, and certainly was not so safe. Reference was then made to statistics given by Tecvan, of London, who had collected 1,095 cases with only six deaths. Dr. Weir thought that such was not a proper ratio to put forth, with reference to the success of the operation of internal urethrotomy, because in the collection were 291 cases reported by Mastin, of Mobile, without any deaths. The reason why Dr. Mastin had been so successful in such a large number of cases was because the strictures occurred for the most part in the anterior portion of the canal, where the cutting operation could be performed with almost absolute safety. It was well known that strictures returned after external urethrotomy, and Dr. Weir did not believe that absolute guaranty could be safely given against their return after any operation or method.

He thought the advocates of the cutting operations were not able to prove that every stricture of large calibre, so-called, would contract and form a tight stricture. He further believed that there was a possibility of error in regard to statistics obtained from private practice, and regarded statistics made up from hospital cases as more valuable, because the unsuccessful as well as the successful cases were included. He then gave an analysis of cases of stricture treated in the New York, St. Luke's, and Roosevelt Hospitals. He had collected 150 cases, and among those 14 deaths occurred. There were 51 cases treated by *internal urethrotomy*, and of those 22 were tight strictures, admitting only a filiform bougie. In 10 cases the average-sized bougie used was No. 10. In 31 cases the stricture was situated at the bulbo-membranous junction. In 11 cases the stricture was situated in the front portion of the urethra.

Dilatation was resorted to in 47 cases and with only a single death.

There were 28 cases of external urethrotomy and six deaths.

There were 51 cases of internal urethrotomy and three deaths.

Dr. Otis remarked, in explanation, that in the greater proportion of his cases in which he had performed internal urethrotomy, the stricture had been situated within the anterior four inches of the urethra. He believed it would be found that in the greatest proportion of cases, stricture occurred in the anterior portion of the canal.

He believed it to be true also that the greatest portion treated by dilatation of the deep urethra were spasmodic and dependent upon reflex irritation from anterior strictures, which had been overlooked.

A very common mistake made by surgeons was to institute treatment for deep-seated stricture where no examination for anterior stricture had been made; the difficulty, as a rule, was in the anterior portion of the urethra, and when the strictures situated there were cured, the supposed contraction, in nine out of ten cases, at the deeper portion of the canal had disappeared. The condition at the deeper portion of the canal, in such cases, was a spasmodic stricture, the result of irritation produced by the anterior stricture. He was opposed to urethrotomy in the deep portion of the urethra, unless it was absolutely necessary, and its necessity depended very much upon the fact whether or not the anterior portion of the canal was perfectly free from contractions. No operation should be performed upon the deep portion of the urethra until strictures in the anterior portion had been thoroughly removed.

Dr. Gross remarked that no surgeon should determine the existence of stricture in the deeper portion of the urethra until its anterior portion had been relieved entirely of disease, whatsoever the disease might be—stricture, hyperæsthesia, etc., etc. In the rational treatment of stricture the object should be to overcome all irritability and hyperæsthesia even before exploring the urethra for any purpose.

Dr. Weir had suggested the possibility of error in statistics gathered from private practice as compared with hospital cases. Of Dr. Gross's cases seventy-five were in private practice and no deaths occurred among them. He had met with a mortality as high as three in twelve cases operated upon in the Blockley Hospital. Philadelphia.

With relation to dilatation, divulsion, and internal urethrotomy, Dr. Gross simply maintained *that no gentleman in the room had ever cured a case of stricture of the urethra by gradual dilatation.* The symptoms were perhaps relieved, and the patients were made comfortable, but when the use of the instrument was ceased for a short time the symptoms returned. Simple gradual dilatation, especially as practised by some surgeons in New York who stopped dilatation with the size of the instrument which distended the meatus, was useless as *a method of cure.* Dr. Gross was willing to stake his reputation upon the statement, and asked the appointment of a committee by the President to test it, that while dilatation did good, relieved symptoms and made the patient comfortable, it *did not* rid him of the cicatricial tissue which was deposited in the submucous, the mucous, and the erectile tissue.

The result of inflammatory action and the deposit of new material was adhesion of the normal longitudinal folds in the mucous membrane of the urethra, so that when the patient made water the urethra was not normally distended, because the mucous membrane was not unfolded. The simple passage of an instrument, even repeatedly, would no more unfold those adhered folds of mucous membrane than would efforts at stretching the tendo-Achillis bring the heel down in old talipes equinus. The idea had been advanced by Dr. Gouley, that in *divulsion*, and possibly in full dilatation, there was more or less divulsion; a cicatricial splice was put in, so that when the bladder was being emptied it was possible for the urethra to expand to its natural size.

Dr. Gross maintained that such splice could *not* be put in by dilatation simply. He believed in divulsion in cases in which the symptoms were urgent. It was a bad operation, however, unless followed by the bulbous explorer for the purpose of detecting undivided bands, and having detected them, they should be divided by the urethrotome. Dr. Gross did not hesitate to say that it was as safe to divide the deep portion of the urethra as any other when a proper instrument was employed. He objected to Dr. Otis's instrument on the ground that it was a *divulsor*, as well as a dilating urethrotome.

Internal urethrotomy, in any portion of the urethra, was as safe an operation, *if the kidneys and other portions of the genito-urinary apparatus were healthy*, as the simple introduction of a catheter. He had had two cases in which simple introduction of the catheter had been followed by death, and yet he had not ceased to introduce the catheter because two patients had died in consequence. In conclusion he stated that the rational treatment of stricture consisted in restoring the normal calibre of the urethra, but that it could not be done by dilatation, for the bands would be just as apparent after such treatment as before; and that to permanently cure stricture a new piece must be put into the unfolded mucous membrane, which was best done by internal urethrotomy.

Dr. Stein thought that internal urethrotomy should not be undertaken without due consideration of the seat of the stricture and the condition of genito-urinary apparatus of the patient. His experience had been that cutting operations on the deep portions of the urethra were dangerous, on account of hemorrhage and urethral fever. The danger of the operation, either divulsion or internal urethrotomy, was very much increased when performed at a depth of more than four and a half inches from the meatus, and the danger increased in proportion to the contraction of the urethra. The pathological changes in the urethra, as was well known, in cases of stricture of large calibre were not so great as in connection with close strictures, hence they were more amenable to treatment, and operations upon them were less dangerous than operations upon tight strictures.

On motion by Dr. Sayre a vote of thanks was extended to Dr. Gross for his interesting paper, and the Association adjourned.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from June 2 to June 8, 1878.

Head, Jno. F., Lieut.-Col. and Surgeon. Granted leave of absence for two months. S. O. 47, Div. of the Atlantic, June 4, 1878.

Winne, C. K., Capt. and Asst. Surgeon. Granted leave of absence for one year from June 1, 1878, on Surgeon's certificate of disability. S. O. 120, A. G. O., June 4, 1878.

O'Reilly, R. M., Capt. and Asst. Surgeon. Assigned to duty as Post-Surgeon at Charleston, S. C. S. O. 65, Dept. of the South, June 4, 1878.

Newlands, Wm. L., 1st Lieut. and Asst. Surgeon. Granted leave of absence for four months, with permission to go beyond sea. S. O. 121, A. G. O., June 5, 1878.

Medical Items and News.

Contagious Diseases — Weekly Statement.— Comparative statement of cases of Contagious Diseases reported to the Sanitary Bureau, Health Department, for the two weeks ending June 8, 1878.

Week Ending	Typhus Fever.	Typhoid Fever.	Scarlet Fever.	Cerebro-spinal Meningitis.	Measles.	Diphtheria.	Small-pox.

American Neurological Association.—The (adjourned) Fourth Annual Session of this Association will be held on Wednesday, June 19th, at 2 o'clock P.M., in the lower lecture-room of the College of Physicians and Surgeons, Twenty-third street and Fourth Avenue, and will continue three days.

J. S. Jewell, M.D., *President.*
E. C. Seguin, M.D., *Rec. Secretary.*

Prof. v. Siebold, of Munich, the Nestor of German zoölogists, celebrated, on April 22d, his fifty-year Doctor-jubilee. The Royal Academy of Sciences and the University of Munich sent deputations to bear their congratulations to the aged professor, and many other Universities and learned societies, both German and foreign, sent congratulatory letters. The King of Bavaria signalized the occasion by conferring on Dr. Siebold the cross of Commander of the Order of St. Michael.

The Plague.—Advices from Bagdad to May 7th state that it is rumored there that the plague has broken out in Ispahan. In Körsandjak, which lies to the south of the Urmia Sea, an epidemic disease,

which resembles the plague, has broken out. According to Russian advices from Teheran, the plague has raged in Sondj-Bulak (Persian Kurdistan) for three months, and has already caused 400 deaths. The epidemic of supposed malignant erysipelas in Hamada has turned out to be an epidemic of pustula maligna. The disease attacks principally the leather-workers of the town.

MEDICAL EDUCATION IN ILLINOIS.—At a recent meeting of the Illinois State Board of Health, held at Cairo, the following resolutions were unanimously adopted: *Resolved*, That on and after July 1, 1878, the Board will not consider any Medical School in good standing which holds two graduating courses in one year. *Resolved*, That on and after July 1, 1878, the Board will not recognize the diplomas of any Medical School which does not require of its candidates for graduation the actual attendance upon at least two full courses of lectures, with an interval of six months or more.

NEW YORK ACADEMY OF MEDICINE.—At a stated meeting held May 2, 1878, Dr. E. L. Partridge was elected Resident Fellow, and Francisco Rizoli Corresponding Fellow of the Academy. Drs. Willard Parker, Fordyce Barker, and E. R. Squibb were appointed a committee to confer with committees from other Societies in relation to an effort to secure the passage of a law to prevent the adulteration of food and medicine.

LOSSES OF THE RUSSIAN ARMIES.—According to the *Golos* and other Russian journals, the united losses of the Russian armies in Europe and Asia by death, up to the 30th of last January, amounted to between 120,000 and 150,000 men. This includes those who perished from disease and exposure, as well as those who died from their wounds, or were killed in battle. According to the official *ordre de bataille*, the effective force of the Russian armies in the Balkan peninsula was from 300,000 to 320,000 men, and that of the armies in Asia from 180,000 to 200,000 men. To these must be added from 40,000 to 60,000 Cossacks, divided between the two fields of operations.

BREVET BRIG.-GENERAL J. J. B. WRIGHT, a veteran medical officer of the United States Army, and among the most widely known and esteemed of the medical staff, died at his residence in Carlisle, Pa., May 14, 1878. General Wright was born in Wilkesbarre, Pa., in May, 1801, where his parents had long previously resided. He received the degree of A.B. from Washington College, Pa., and, a few years subsequently, graduated in medicine at the University of Pennsylvania; he afterwards received an honorary degree of Doctor of Medicine from the Jefferson Medical College. Dr. Wright commenced the practice of his profession near his native town, and though soon engaged in a large practice, he was induced by his brother, Major Thomas Wright, Paymaster, U. S. A., to present himself for examination before the Army Medical Board—was approved, and appointed Assistant Surgeon, U. S. A., Oct. 25, 1833. During the first ten years of Assistant Surgeon Wright's official career, his services were at stations far beyond the centres of commerce and the busy marts of trade, and at ports accessible only after weeks of travel. He participated in the operations against the Seminole Indians in Florida, 1841–42, and here rendered efficient and valuable service.

In 1846 he was attached to General Zachary Taylor's "army of occupation," was present at the battles of Palo Alto, and Resaca de la Palma, and received especial commendation from his commanding officer for efficiency and zeal in the performance of arduous duties; immediately subsequent to these operations he had charge of the General Hospital at Matamoras; during the campaign from Vera Cruz to the city of Mexico, Surgeon Wright was Medical Purveyor of the army; he was especially commended for efficiency at the battle of Cerro Gordo; at Contreras and Churubusco he performed his duty in such manner as to elicit especial mention in the report of General Worth, who also alludes to him in terms of high commendation in the report of the operations of his division at Molino del Rey. Soon after the Mexican war, Surgeon Wright was on the staff of Major-Gen. Worth, with headquarters at San Antonio, Texas; he served here during the prevalence of an epidemic of Asiatic cholera of unprecedented violence. Subsequently he was engaged in various expeditions in the West during 1857 and 1858. During the late war, Surgeon Wright, while on the staff of Generals McClellan and Rosecrans, participated in some of the engagements in West Virginia. Afterwards he was Medical Director, Department of the Missouri, on the staff of General Halleck. He attained the grade of Colonel and Brevet Brigadier-General, and was retired from active service in December, 1876. General Wright was a man of great urbanity, a true soldier in his instincts, never permitting any personal considerations to interfere with the strictest discharge of duty; of acknowledged professional skill; fair and honorable in all his official and social relations. He had many warm personal friends among the old enlisted men of the army, and held a high place in the esteem of his associates, both in and out of the medical staff. *Requiescat!*

STATE MEDICAL SOCIETY OF ARKANSAS.—Since the disbandment of the old Arkansas State Society by a decision of the Judicial Council of the American Medical Association, the new society has issued a conciliatory circular inviting the old members to join.

A CASE OF ABSCESS FOLLOWING A HYPODERMIC INJECTION OF DIALYZED IRON.—Dr. W. M. Kemp, of this city writes: "The statement of a very flattering result following the hypodermic use of dialyzed iron in the treatment of anæmia published by Prof. Da Costa, leads me to report a case of abscess following a similar experiment. Mrs. I., a very anæmic woman, who had taken various preparations of iron without any marked benefit, received a hypodermic injection of ten minims of dialyzed iron in the left arm about the insertion of the deltoid muscle. Immediately following the injection she became much cyanosed and unconscious, the respiration and pulse being barely perceptible. The recumbent position, air, and stimulants, together with artificial respiration, overcame this condition, but for the remainder of the day any effort to raise the head was followed by a recurrence of the above symptoms, which however gradually wore off. The point of puncture remained very much swollen, tender, and inflamed; the swelling extended over a surface of four inches. At the end of a week the abscess became pointed and discharged about a drachm of fluid resembling in color and consistence the iron injected. After poulticing for a few days about three ounces of pus were discharged and the abscess healed. The preparation of iron used was a freshly opened bottle from Wyeth, of Philadelphia. Notwithstanding the unpleasant result in this case, the patient is desirous of having the remedy used again, but before attempting it, I wait the report of other cases in which the remedy has been successfully used."

To the Medical Profession.

LACTOPEPTINE,

The most important remedial agent ever presented to the medical profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase or Veg. Ptyalin, Lactic and Hydrochloric Acids, in combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk,	40 ounces.	Veg. Ptyalin or Diastase,	4 drachms
Pepsin,	8 "	Lactic Acid,	5 fl. "
Pancreatine,	6 "	Hydrochloric Acid,	5 fl. "

Powder and Mix.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned, having tested REED & CARNRICK's preparation of Pepsin, Pancreatine, Diastase, Lactic Acid, and Hydrochloric Acid, made according to published formula, and called LACTOPEPTINE, find that in those diseases of the stomach where the above remedies are indicated, it has proved itself a desirable, useful and well-adapted addition to the usual pharmaceutical preparations, and therefore recommend it to the profession.

NEW YORK, *April 6th*, 1875.

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

LEWIS A. SAYRE, M.D.,
Professor of Orthpœdic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Prof. of Chem., Mat. Med. and Therp. in the N. Y. College of Dent.; Prof. of Chem. and Hygiene in the Am. Vet. College, &c., &c.

PRICE LIST.

LACTOPEPTINE (Powder in oz. Bottles) per oz.	$1 00	Elixir Lactopeptine, Strychnia & Bismuth, per doz.	$15 00
" (Powder in oz. Bottles) per doz.	10 00	" Calisaya Bark & Iron, with Lactopeptine, "	15 00
" (Powder in ½ lb. Bottles) per lb.	12 00	Beef, Iron and Wine, with Lactopeptine, "	12 00
Elixir Lactopeptine.....per doz.	15 00	Liquid Lactopeptine..... "	15 00
" Lactopeptine and Bismuth..... "	15 00	Syrup Lactopeptine Compound..... "	15 00

Physicians, upon examining these pills and giving them a trial, will be convinced that they can rely upon them as confidently as if made under their immediate supervision. They can be procured either through pharmacists or directly from us. The above is only a partial list, and we shall be happy to supply a complete one, priced, and samples of the pills upon application.

W. H. Schieffelin & Co., 170 William St., N. Y.

Druggists when ordering, and Physicians when prescribing, will please be particular to specify *Schieffelin's* Pills.

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

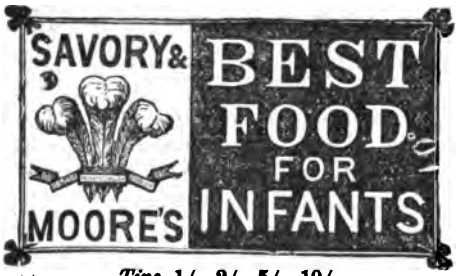
Pancreatic Emulsion, may therefore be regarded as Chyle obtained by nature's own process.

In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatizing Cod-Liver Oil, the active digestive priciple of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Peptodyn, the New Digestive, is a combination of the whole of the digestive secretions—Pepsine, Pancreatine, Diastase, &c., forming an invaluable remedy in the treatment of all forms of Dyspepsia, and all diseases arising from imperfect nutrition.

N.B.—*The success of this Remedy has led to several imitations of it*, which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.



Tins, 1/-, 2/-, 5/-, 10/-

AS SUPPLIED TO

THE ROYAL NURSERIES

of England, Russia, Etc.,

AND CONTAINING THE

HIGHEST AMOUNT OF NOURISHMENT

IN THE

MOST DIGESTIBLE AND CONVENIENT FORM.

THE MOST PERFECT SUBSTITUTE FOR HEALTHY MOTHER'S MILK.

DATURA TATULA FOR ASTHMA, ETC.

A powerful and universally adopted Remedy.

"By immediate contact with the air cells and passages, instant relief is given."—Dr. LATHAM, *Physician to the Queen.*

"A remedy of great power and usefulness in Asthma, Chronic Bronchitis, &c."—Dr. W. BARKER.

"The smoke causes no nausea. I have never known an instance in which relief was not obtained."—GENERAL ALEXANDER.

In Tins, for use by means of a pipe, Cigars and Cigarettes, and Pastilles for Inhalation.

TO PHYSICIANS AND DRUGGISTS.

THE subject of Unbleached and Hospital Quinine has been so much discussed of late, and appears to be so little understood, that it is deemed proper to submit the following, which is in accord with our best knowledge and experience in the purchase and use of this article, for it should be remembered that the processes used in the manufacture of Quinine in all countries are kept secret by the various manufacturers, who are a limited number, and said to be comprised within about fifteen establishments of much importance.

Bleached Sulphate of Quinine is recognized as pure when it will bear what is called the ether test, which, while it is not an absolute standard, is the recognized and accepted test, and should be applied in accordance with the directions of the United States Pharmacopœia to all white or Bleached Sulphate of Quinine.

Unbleached Quinine has been regarded with favor in pharmaceutical manufactures, because it has been usually quoted by our manufacturing chemists at from 30 to 40 cents per oz. cheaper than the Bleached, and there has existed among many physicians a prejudice in its favor as a more natural preparation, even if it did contain a small percentage of the other alkaloids of bark. It has been used in general by many of our best and most accomplished pharmacists under this supposition, and was used by us extensively until last fall, when our experiments in manufacturing Quinine from Bark and recovering Quinine from Gelatine-Coated Pills (which we had from time to time rejected on account of irregular shape or imperfect coating) taught us in reality that our previous methods of analysis and determination of this important salt were defective; further, that there were in market two quite distinct articles in proportion of constituents, the one being evidently an arrested manufacture, or Quinine as the result of probably a single crystallization in place of four, as usually required to separate completely the cinchonidia and quinidia, and bring the result up to the ether test; and another article, the result of concentration and crystallization of the so-called mother waters used in successive crystallizations, as before explained, which carry, with the salts of cinchonidia and quinidia in solution to be eliminated, a nearly equal amount of quinia, the result being, as far as our experience goes, from 35 to 45 per cent. of quinia sulphate in combination with cinchonidia sulphate mainly and a small portion of quinidia sulphate.

This latter article, which we have denominated Hospital Quinine to distinguish it from the first described Unbleached (although the terms have often been applied synonymously), we have reason to believe was sent us in the last shipments we received, notwithstanding the manufacturers' contract and our former erroneous method of analysis to the contrary.

The discovery of these facts, on our part, *for the first time* last autumn, led to consultation with several distinguished chemists and pharmacists, and the whole ground was carefully reviewed and examined, and the conclusion arrived at was that all ordinary tests in inexperienced hands for quantitative analysis of Quinine, when it was in natural combination with the other alkaloids of cinchona bark, could not be relied upon, and the only safety in general pharmaceutic manufacture consisted in the use of bleached or white Quinine.

This determination was announced by us last fall in the various journals, as was supposed in sufficient explanation, it having always been our custom to fully explain and inform the trade in regard to our methods of business, which are always open.

We regret only that we are not able to give more specific and positive additions to knowledge about this matter of Quinine and the other cinchona alkaloids, because it deserves and is receiving very much attention and investigation at the hands of Physicians and Chemists as one of the most valuable of all remedies, and that since our change from unbleached to bleached Quinine last November, evil disposed persons have taken occasion to misrepresent and misconstrue the facts for selfish purposes. There are fortunately a few facts that cannot be misconstrued. From our first connection with the inventor of the machinery for making Gelatine-Coated Pills, which commenced with the furnishing of materials for manufacture to the inventor in 1871 till November 24th, 1877, only unbleached Quinine was used, and it was as carefully examined as could be by various analysts until 1876, when our present analyst entered into our employ, highly recommended for general knowledge and experience, and deservedly so outside of Quinology, which is the most difficult of subjects, because of variety in raw material and in alkaloids that are so very similar as to be most difficult of entire separation. Since November 24th, 1877, we have *only used Bleached Sulphate of Quinine* in our Sulphate of Quinine Pills, as stated in our circulars.

We will remark that we believe, as the result of much experience, that a natural combination of the alkaloids of cinchona bark in good proportion is a better therapeutic for general use than any single alkaloid separated, and we attribute much of the favor attending our peculiar form of coating to the use of Unbleached Quinine as employed up to November last in the proportion of 111 ozs. (more or less according to our then supposed analysis) in place of 100 oz. of Bleached, as has been formerly carefully explained, but we defer this subject to the experience of the physician, being out of the province of the druggist.

It is the duty of the druggist and pharmacist to be well informed and not to misrepresent or conceal any fact in experience in manufacture or investigation, and we will be pleased to do this at all times, when called upon, as only thus can knowledge be advanced or confidence maintained; hence this article, which is respectfully submitted.

McKESSON & ROBBINS.

COLLEGE OF MEDICINE

—OF—

SYRACUSE UNIVERSITY.

Syracuse, New York.

FACULTY.

JOHN TOWLER, M.D.,
Professor of Chemistry and Toxicology.

FREDERICK HYDE, M.D.,
Professor of Principles and Practice of Surgery.

HENRY D. DIDAMA, M.D.,
Principles and Practice of Medicine and Clinical Medicine.

NELSON NIVISON, M.D.,
Professor of Physiology, Pathology and Hygiene.

JOHN VAN DUYN, M.D.,
Professor of General, Special and Surgical Anatomy.

CHARLES R. RIDER, M.D.,
Professor of Ophthalmology and Diseases of the Ear

HARVEY B. WILBUR, M.D.,
Lecturer on Insanity.

WILFRED W. PORTER, M.D.,
Professor of Obstetrics and Diseases of Women.

WILLIAM T. PLANT, M.D.,
Professor of Clinical and Forsenic Medicine, and Diseases of Children.

ROGER W. PEASE, M.D.,
Professor of Operative and Clinical Surgery.

ALFRED MERCER, M.D.,
Professor of Minor and Clinical Surgery.

J. OTIS BURT, M.D.,
Professor of Materia Medica.

MILES G. HYDE, M.D.,
Adjunct Professor of Anatomy.

WM. MANLIUS SMITH, M.D.,
Professor of Medical Chemistry and Botany

J. W. KNAPP, M.D.,
Demonstrator of Anatomy

DAVID M. TOTMAN, M.D.,
Instructor in Physiology.

BRACE W. LOOMIS, M.D.,
Instructor in Histology.

J. G. JUSTIN, M.D.,
Instructor in Chemistry.

G. R. METCALF, M.D.,
Instructor in Materia Medica.

This school was organized in 1872. In the arrangement of its curriculum, special reference has been had to the increasing demand for a more thorough and systematic culture than is usually given in American Medical Colleges.

Experience having shown it to be impossible to present even the essentials of medicine in a series of lectures extending through four or five months, the course in this school has been graded and extended to meet the varied needs of students.

The College Year begins on the first Thursday in October, and ends on the second Thursday in June. It is divided into two terms nearly equal in length. There is a vacation of two weeks between the terms.

The studies are divided into those of the first, the second and the third years.

1st Year Studies—Anatomy; Physiology; General Chemistry; Histology and Botany.

2d Year Studies—Continuation of Anatomy and Physiology; Medical Chemistry; Materia Medica; Practice; Surgery; Clinical Medicine and Surgery.

3d Year Studies—Materia Medica; Practice; Surgery; Clinical Medicine and Surgery; Obstetrics; Diseases of Children; Forensic Medicine; Gynecology and Ophthalmology.

Instruction is given by lectures, recitations and frequent and various practical exercises. Students of the first year are taught the use of the microscope and practical histology, and receive a thorough course in analytical chemistry.

Botany is taught during the second term of the first year.

To students of the second and third years all necessary facilities for clinical instruction are afforded by two good hospitals and the *College Dispensary*.

This school makes no distinction as to sex. Women and men receive precisely the same instruction. The system of co-education has been pursued since the school was organized *with results that fully warrant its* continuance.

Examinations are frequent and thorough. Students who join the school for the regular course are examined as to their qualifications for the study of medicine, unless they present evidence of scholarship from some creditable source. At the end of the second year final examinations are given in Anatomy, Physiology and Chemistry.

Students at home or in an office who may desire to join our second year will come prepared for examination on the bones and muscles in Anatomy; on nutrition, in Dalton's Physiology; and on the inorganic part of Attfield's Chemistry.

☞ Students who do not intend to become candidates for the degree may be received at any time and make their own choice of studies. A certificate of time will be given on application to the Registrar.

Requirements for Graduation.—Twenty-one years of age; good character; three full years of medical study: one continuous year at this school, and *satisfactory examinations*. Thesis not required.

FEES AND EXPENSES.

For Matriculation	$5 00	**For Graduation**	$25 00
Tuition for the Year	100 00	**Demonstrator's Fee**	5 00
For either Term alone	65 00		

The fee for the third year to students who have fully paid the first and second years will be $50.00.

Students in the Chemical Laboratory will be charged $5.00 per term for Laboratory expenses.

Students not in the regular course, receiving instruction in one or two branches, are charged, after matriculation, $18.00 per term for a single study.

Board may be obtained for $3.50 and upwards.

For other information, address the Registrar,

WM. T. PLANT, M.D., Syracuse, N. Y.

Pneumatic Aspiration

AFTER THE MANNER OF DIEULAFOY.

"It is always possible, owing to Aspiration, to search for a fluid collection without any danger, whatever may be its seat or its nature."

"I have thrust these needles into almost every part of the body; into the Joints, the Liver, the Spleen, the Bladder, the Intestines, the Lungs and the Meninges; and I can affirm, and a great number of observers affirm with me, that we have never seen consecutive accidents."—*Dieulafoy on Pneumatic Aspiration*, pp. 21, 24.

We invite the attention of the Medical Profession to this New Apparatus for Aspiration, constructed upon the general plan of Potain's modification of Dieulafoy's Aspirator, but containing the following improvements and inventions of our own:

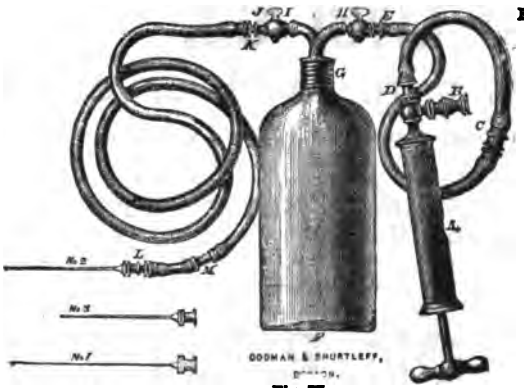

Fig. 77.

Fig. 68.

Fig. 78.

The Stopper and Cocks supplied with Apparatus No. 2.

1st. Means of changing the pump from an exhaust to a force-pump, and *vice versa*, thereby enabling the operator not only to draw an abnormal fluid, but to inject the cavity through the tubes and needle of the apparatus with one adapted to induce healthy action.—*See Dieulafoy on Aspiration*, pp. 276, 278.

2d. The employment, in our apparatus No. 1, of a metal Screw Cap, fitting the neck of the receiver supplied with this apparatus so securely that it cannot be forced from its place by condensed air while injecting, or accidentally removed while the receiver is in a state of vacuum for aspiration.

3d. The substitution, for the ordinary oiled silk valves of other apparatus, of a kind indestructible, both in form and material.

4th. A simple and comparatively inexpensive attachment for evacuating the contents of the stomach, equal, if not superior, to any in use hitherto.

Commendations bestowed upon our Aspirators, by physicians familiar with the latest European and American ones, lead us to believe that, in some important particulars at least, they are superior to any.

In his work on Pneumatic Aspiration, Dieulafoy shows the harmlessness of the Aspiratory puncture and its great superiority to the Exploring Trocar as a means of accurate diagnosis in all collections of Pathological Fluids. It has been used with unprecedented success in the Retention of Urine, Reduction of Strangulated Hernia, in Ascites, Hydrothorax, Empyema, Pneumothorax, Effusions into the Pericardium, Serous, Purulent and Hematic Effusions of the Knee, Hydrocele, Hydatid Cysts, Abscesses of the Liver, and in various other Pathological Lesions.

PRICES OF APPARATUS

No. 1. Air Pump—exhaust or condensing as described; 16 oz. receiver, of strong glass, with screw-cap; three steel, gold-plated Aspiratory Needles, together with the necessary tubes, stop-cocks, etc., as shown in Fig. 77, fitted in a neat case, accompanied with printed directions..... $18 00

No. 2. The same, without receiver, and with rubber stopper (see Fig. 78), to fit almost any bottle of quart capacity, or less, instead of screw-cap arrangement, also with printed directions, 16 00

No. 3. Dieulafoy's Notched Aspirator, Nickel-plated, with two Needles, Tubes, etc., in case..... $14 00

No. 4. Stomach Attachment, as described, adapted to pump accompanying Nos. 1 and 2, additional..... 6 00

The foregoing are the product of our own factory, and are warranted in every respect.

Also, **Dieulafoy on Pneumatic Aspiration,** post-paid, by mail, on receipt of..... 3 40

☞ *Full description on application.*

An Illustrated Catalogue of Surgical Instruments, also a New Pamphlet on Atomization of Liquids, with description of Improved Apparatus and Formulæ of Remedies successfully employed, will be forwarded, post-paid, on application.

CODMAN & SHURTLEFF,

Makers of Surgical Instruments,

13 and 15 Tremont Street, Boston.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt, and all its combinations.

EXTRACT OF MALT,

With Cod Liver Oil,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO

(See Transactions of American Medical Association, for 1876, page 176),

Is presented to the Medical Profession as an efficient, palatable, and very stable combination, consisting of equal parts of the **Extract of Canada Barley Malt** and the best quality of genuine **Norwegian Cod Liver Oil.** Many patients take this preparation who can not take the oil in any other form. It may be employed in all cases where Cod Liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

EXTRACT OF MALT,

With Cod Liver Oil and Phosphorus,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod Liver Oil, Phosphorus being added in the proportion of 1-100 grain to the dose, and so combined, as to be perfectly protected from oxidation. The **Trommer Extract of Malt Company** prepare this combination agreeably to the suggestion of **Dr. Wilson Fox.** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

EXTRACT OF MALT,

With Cod Liver Oil and Iodide Iron

Added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod Liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians referring to it in terms of high praise.

MANUFACTURED BY

TROMMER EXTRACT OF MALT CO.,

FREMONT, OHIO.

NEW REMEDIES.

☞ Your Special Attention is Called to the Note below.

QUININE FLOWER.—Used in the South during the late war, to some extent as a substitute for quinine, and now introduced to the profession by us.

YERBA REUMA.—From the Pacific slope, now introduced by us. Used in diseases of the mucous passages, especially in catarrh, acute and chronic, leucorrhœa, gonorrhœa, and dysentery.

KAVA KAVA.—From the Sandwich Islands. First introduced by us. An efficient and agreeable remedy in gonorrhœa, gleet, gout, and rheumatism.

CASCARA SAGRADO.—Introduced by us. It has long been regarded by the residents of the Pacific Coast as a sovereign remedy for habitual constipation and dyspepsia.

COTO BARK.—From Bolivia. First introduced by us. It is said to be almost a specific against diarrhœa in its various modifications.

COCA LEAVES.—A powerful nervous excitant, giving great vigor to the muscular system and sustaining the human frame under extreme physical exertion and fatigue.

PARAGUAY TEA.—Largely used in South Africa as a stimulant to sustain the system when undergoing hunger, or great fatigue during the summer heats.

GRINDELIA ROBUSTA.—From the Pacific Slope. Since this drug was first introduced by us, it has earned for itself a reputation for almost specific curative action in asthma.

GUACO LEAVES.—This valuable remedy was also first introduced by us. Its use is indicated in cholera, diarrhœa, chronic rheumatism, etc.

BERBERIS AQUIFOLIUM.—A new California drug, now introduced by us, possessing extraordinary powers as a combined alterative and tonic, and valuable in syphilitic and scrofulous diseases, salt rheum, etc.

BOLDO LEAVES.—First introduced by us. The new South American tonic. In France it has been employed in cases where quinine could not be tolerated.

ARECA NUTS.—First introduced by us. From India. Strongly astringent. Used by Dr. Morris, of England, in the removal of tape worm.

GRINDELIA SQUARROSA.—From California. First introduced by us. An excellent and efficient remedy in malarial diseases, enlarged spleen, etc.

YERBA SANTA.—From Northern California. First introduced by us. This drug is a standard remedy in Western States in bronchial and laryngeal disorders.

FUCUS VESICULOSUS.—First introduced by us. An anti-fat remedy of great merit. No derangement of the stomach or general system seems to result from its use.

NOTE.—There are several false varieties of this plant, which are offered as genuine. Physicians will readily perceive the difference in the taste of the fluid extract, as compared with our preparation of the TRUE plant.

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*

Pints, 4 dozen in a case $9 00
Quarts, 2 dozen in a case 7 00

In Saratoga. *Delivered at the Cars.*

Pints, 4 dozen in a case $6 00
Quarts, 2 dozen in a case 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.**, or to the Company's office, **205-213 E. 12th St., New York**, will receive prompt attention.

TAMAR INDIEN

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris.

To be had of all Respectable Chemists throughout the world.

MEDICATED DISCS

FOR HYPODERMIC INJECTION.

SPECIAL NOTICE.

Messrs. SAVORY & MOORE beg most respectfully to inform the MEDICAL PROFESSION generally that the great demand which has arisen for their **GELATINE PREPARATIONS,** since they were first introduced, has compelled them to extend their Laboratory in New Bond Street, by the erection of a Department for the exclusive purification and manipulation of these articles. The discs for **HYPODERMIC INJECTIONS,** and for **OPHTHALMIC PURPOSES,** as well as the **LAMELS FOR INTERNAL USE,** will henceforth be prepared under the **immediate supervision of the Firm.** This Special Department is so arranged that the delicate process of manufacturing the Sheets of Gelatine cannot possibly be interfered with, and consequently the **perfect purity** and **accurate dosage** of these important and delicate preparations may be **THOROUGHLY RELIED ON.**

The HYPODERMIC DISCS are now sold in boxes, which have been found to be of greater advantage for their preservation than the leather wallets originally employed.

SAVORY & MOORE, 143 NEW BOND STREET, LONDON, ENGLAND.

QUINETUM PILLS

(Sugar-Coated.)

The name **Quinetum** was given by Dr. De Vry to the collective alkaloids obtained from Peruvian bark; it has been extensively used by physicians throughout Holland in cases where the salts of quinine had been habitually employed. Dr. H. J. Vinkhuysen, Physician to the Household of the King of the Netherlands, has closely observed its effects, and arrived at the following conclusions:

1. The action of Quinetum in cases of marked or larval malaria, and especially in rheumatic affections due to malarious influences, is incomparably greater than that of quinine.

2. The tonic action of Quinetum is similar to, and even greater than that of quinine.

3. The influence of Quinetum in chronic cases is greater than that of quinine.

4. Persons who are liable to suffer from the toxic effects of quinine, and who therefore cannot take it without the greatest discomfort, can take Quinetum without this unpleasant effect, and yet obtain a similar therapeutical result.

5. Quinetum never causes noises in the ears.

6. Quinetum does not produce the unpleasant and even dangerous symptoms of quinine when given during the fit, and may be taken during the fit without causing any unpleasant feeling.

7. In all forms of pure malarial intermittent fever, Quinetum has the same apyretic effect as quinine, but is less powerful and acts more slowly. It must therefore be given in large doses, and at longer intervals before the ague fit, than quinine.

8. The only malarious disease in which Quinetum cannot be employed in place of quinine, is in pernicious fever. Quinetum requires more time to act than quinine, and as rapidity of action is absolutely necessary in this disease, Quinetum cannot be used in it as a substitute for quinine.

These Pills may be obtained of Druggists, or will be sent by mail, post-paid, on receipt of price.

BOERICKE & TAFEL'S
FRESH PLANT
TINCTURES OR ESSENCES.

These are prepared exclusively from fresh plants gathered when in their full vigor, thus retaining all volatile constituents usually lost in drying, and utilizing all such juices, which are partly changed or rendered to a more or less degree insoluble by drying.

Medicinal plants growing in this country we gather ourselves, while of European plants we import the ready-made essences.

These plants are divided into three classes, and the treatment accommodated to their greater or less degre of succulence.

Tinctures according to **Class I** are made by adding one part of the expressed juice of the plant, one part of Alcohol.

Tinctures according to **Class II** are made from three parts of the plant to two parts of Alcohol by weight.

Tinctures according to **Class III** are made from one part of the plant to two parts of Alcohol by weight.

To distinguish these Tinctures from those of the U. S. Pharm., the Greek letter θ (theta) is written after their names on the label, and *appended to each bottle is a label giving the proportion of the plant in the tincture.*

These fresh plant tinctures are sold at the following rates, with few exceptions:

1 oz. 25 cts.; 2 oz. 45 cts.; 4 oz. 85 cts.; 8 oz. $1.60; 1 lb. $3.00.

LAZELL, MARSH & GARDINER'S
POWDERED
MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory; and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them. Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts.*

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

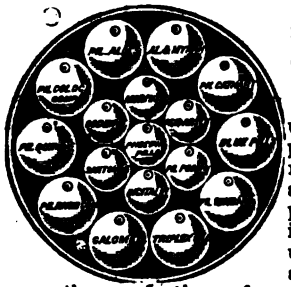
Printed Pills and Granules



These new pills and granules are the only real improvement made in pills for many years. While they are a novelty, their principal claim to superiority lies in the fact that they have undoubted advantages over all other pills, and are at once the perfection of accuracy, and a safeguard against mistakes or substitution. Their claim to the confidence of the medical profession and pharmacists rests on the entire purity of the ingredients used; perfect accuracy of composition and uniformity of size; ready solubility; tastelessness and harmlessness of the coating, which is vegetable; perfect preservation in all climates; entire security against mistakes or substitution, every pill or granule having printed upon its surface either its common name or its composition, as Pil. Cath. comp., or Pil. Quin, 1 grain.

We now offer the following assortment:

Granules, containing 1 milligramme, or 1-64th gr.: Arsenious Acid; Arseniate of Soda; Aconitine; Atropine; Digitaline; Bi-chloride of Mercury; Sulph. of Morphia; Phosphorus; Strychnia.

" containing 4 milligrammes, or 1-16th gr.: Sulph. of Morphia.

" containing 8 milligrammes, or 1-8th gr.: Sulph. of Morphia.

" containing 1 centigramme, or 1-6th gr.: Codeine; Calomel; Proto-iodide of Mercury; Podophyllin.

Pills, prepared according to the U. S. Ph. when officinal: Aloes; Aloes and Assafœtida; Aloes and Mastich; Aloes and Myrrh; Assafœtida; Comp. Cathartic; Comp. Calomel; Comp. Colocynth; Iron, Carbonate; do. Citrate, 2 grains; do. Citrate of, and Quin., 2 grains; do. Pyrophosphate, 2 grains; Blue Pills, 3 grains; Calomel, 5 centigrammes, or 3-4th grain; Podophyllin, 1-6th. 3-4th and 1 grain; Proto-iodide of Mercury, with Opium, Ricord's formula; Quin. Sulph., 3-4th, 1, 1½, 2 and 3 grains; Rhubarb; Comp. Rhubarb; Santonine. 3-4th gr.; Triplex; Valer. Zinc., 3-4th gr.

These pills are sold in bottles of 100 and 500. Other pills will be added, and special formulæ made to order. Descriptive lists, giving assortment and prices, also samples, sent on application.

SOLE AGENTS FOR THE UNITED STATES.

CONCERNING BELLADONNA PLASTER

A Few Words to Physicians and Surgeons.

BY A PHYSICIAN.

Until quite recently Manufacturing Chemists, in offering new combinations and improvements in Pharmacy to the Medical Profession, have found the Faculty very hospitable to the introduction of improvements adapted to their use.

But within a short time, conscientious Physicians have begun to discuss among themselves, very seriously, the propriety of welcoming the newer products of Pharmacy.

Why is this?

Because it is found that certain manufacturers, appealing to the convenience and profit of the apothecary, have been sacrificing merit and therapeutic value to elegance of appearance, and have employed officinal forms and professional nomenclature to foist upon the physician, by aid of the druggist, compounds of little or no value, and altogether unworthy of the high claims made for them.

Thus, the manufacture of medicinal agents for the use of Physicians is rapidly degenerating into empiricism, and is becoming almost as objectionable as the ordinary clap-trap of the "patent medicine" business.

Notably is this true with reference to that important and useful agent, *Belladonna Plaster*.

Dr. J. M. GROSVENOR, graduate of Dartmouth, was the first to appreciate and turn to practical account, an improvement in compounding Belladonna Plaster by using purified rubber as a basis of combination.

His experiments in affecting the combination in therapeutic and mechanical perfection were long continued, exhaustive and expensive.

But he finally succeeded perfectly, and his improved Belladonna Plaster was everywhere welcomed by the Faculty, as being the best form of this agent yet presented. It was universally adopted as the standard Belladonna Plaster.

Why?

Because it proved to be an entirely reliable preparation — presenting the drug uniformly, accurately, and with the most precise and skilful attention to convenience and activity.

The widespread popularity of Dr. Grosvenor's Improved Belladonna Plaster at once attracted the cupidity of empiricism, and the drug market was soon flooded with so-called "Belladonna" Plasters, branded "U.S.P.," and offered to Druggists upon one recommendation, *namely:* "It is 50 per cent. cheaper than Grosvenor's!"

A good many gudgeon like dealers promptly took the bait, and before long physicians began to express surprise and chagrin because Belladonna Plaster did not respond to their expectations in its effects as formerly.

Dr. Grosvenor found himself in receipt of numberless indignant communications upon the subject.

Belladonna Plaster is sold to the druggist in yard rolls, enclosed in a tin case. He cuts it into strips for dispensing as the physician may order.

The mechanical appearance and characteristic odor of Dr. Grosvenor's Improved Belladonna Plaster were closely simulated in the empirical articles; and if the druggist saw fit, for his own profit, to deceive the physician, the latter had no means of detecting the imposition except by noting the effect, and thus it happened that for a long time Dr. Grosvenor's legitimate and always reliable product had to bear the odium belonging justly to the empirics who had assailed him by simulating his article.

Finally he adopted, for the protection of the profession, the expedient of stamping his name at short intervals across the back of his "Belladonna Plaster" in violet ink, but omitting the words "Belladonna Plaster," for reasons which practitioners will understand.

Thus the fraud was checked, wherever the Faculty were informed of the precautionary measure; and the object of this article is to ask physicians everywhere to observe this test of genuineness, and in prescribing, to write for "*Emp. Belladonna Grosvenori.*

The true Belladonna Plaster in rubber combination will always bear this guarantee of genuineness—J. M. GROSVENOR, M.D., (accompanied by a "trade-mark," consisting of a Belladonna Leaf, with the letters B and P upon it in monogram), printed in *fac simile*, at intervals of three inches across the back of the plaster in violet ink.

The profession are reminded that a true Belladonna Plaster, accurately prepared, *cannot* be a *cheap* product. Dr. Grosvenor originally sold his Plaster at the lowest practicable price, and that price has never been changed. Any plaster professing to contain the same elements that is sold at any price considerably lower, stamps itself at once as being the work of quackery.

Dr. Grosvenor has prepared a brief treatise upon Belladonna Plaster, which will be mailed (with sample of plaster) to any physician desiring it.

Physicians, if unable to obtain Dr. Grosvenor's improved Belladonna Plaster at their drug stores, will be supplied direct from the laboratory, by mail, upon receipt of one dollar. This concession is made to physicians only, and to those who cannot obtain the veritable article at home.

Address,

J. M. GROSVENOR, M.D., 22 Park Place, NEW YORK. or **GROSVENOR & RICHARDS, 97 Oliver Street, BOSTON.**

HÆMOGLOBIN,

A dry preparation of blood, which, while being perfectly soluble, will contain in a natural state all the constituents by which it differs from other fluids and tissues, has long been a desideratum among physicians.

The drinking of blood at the Abbatoirs, although the best mode of administration, is, except to a few persons, impracticable—the distance, the expense (always something), the interference of bad weather, and at times the uncertainty of obtaining the blood itself—all render this mode of treatment unsatisfactory to the patient.

Desirous of using the blood-cure for a patient some miles away from an Abbatoir, Dr. J. T. O'Connor, of this city, devised means of making from blood a *dry powder* which is *soluble*, which contains all the constituents of blood, except the serum and fibrin, and especially all the Hæmoglobin in its natural state. The success attending some months' use of this preparation has made a demand for it on the part of his professional friends; and to supply them and others who may desire to test this mode of administering blood, he has given to us the results of his investigation, and is now preparing an article for publication on this subject.

In the mean time, it is offered to the profession as a *nutrient* in simple Anæmia;—in states of exhaustion;—in all cases where Iron seemingly indicated has failed;—and as a means of presenting Iron to the organism in an *organic* state of combination;—*i. e.*, *physiological iron.* A *true* pabulum should be, in his opinion, the result of organic process, and not merely an inorganic substance.

That this preparation is what it is stated to be, is shown by the Spectroscope—*the well-known bands of Hæmoglobin appearing in a solution of the powder so weak that it is barely tinted.*

Where liquid blood in its natural condition is preferred, we have succeeded in preserving it unchanged, and can supply it in any quantity. Yours respectfully,

CASWELL, HAZARD & CO.,

FORMULA.—50 per cent. Pure Cod-Liver Oil, 6 grains of Hypophosphite of Lime, 3 grains of Hypophosphite of Soda to a fluid ounce.

We respectfully recommend this preparation to the medical profession, knowing they will find it of the greatest value in the wasting diseases indicated by a defective nutrition. The oil is so incorporated that the nauseous taste and smell is entirely removed, enabling the most delicate stomach to bear it. But its especial advantage over all other combinations is the perfection and permanency of the Emulsion. We will be pleased to send a sample by express, prepaid, to any physician in the country, if he cannot obtain it at his druggist's.

SCOTT & BOWNE, Manufacturing Chemists, 125 Hudson St., New York.

NEW YORK, *Sept. 4th*, 1876.

Messrs. SCOTT & BOWNE.—*Gents:* I have prescribed Scott's Emulsion of Cod-Liver Oil with Hypophosphites, in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather; and is more palatable than any other preparation of oil that I have used. Yours very respectfully,

ROBERT WATTS, M.D., *President Medical Board Charity Hospital.*

Pullna Bitterwater.

The only Bitterwater that received the Prize at the International Exhibition in Philadelphia in 1876.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of reconvalescence. According to the most minute analysis by Barruel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallized state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromide of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

Children are equally benefited by it, and it is prescribed for them in doses of a tablespoonful in milk at night, either cold or warm.

WARBURG'S TINCTURE.

Made from the original recipe of Dr. Warburg and used as a specific in malarious fevers and all diseases arising from malaria. This preparation is recommended by the English Government, and extensively used in all the English military hospitals, particularly in the East Indies. (see London *Lancet*, Nov. 13, 1875.)

Please specify, in ordering from any wholesale house, **Warburg's Tincture,** made by **F. A. REICHARDT.**

Price per bottle, 1 oz., **75c.**; per doz., **$5.00.** Per pint, **$5.00**; per doz., **$50.00.**

CRAYON'S D'IODOFORM,

Of Dr. Leblond (Annales de Gynecologie) for Superficial Ulceration of the Neck of the Uterus extending to Uterine Cavity. **$1.00** per dozen, sent by mail. Orders executed by return of mail.

F. A. REICHARDT, 404 Fourth Avenue, New York.

REICHARDT'S NITRITE OF AMYL PEARLS.

Specific for Sea Sickness, in 5 drop Pearls.

Let the patient lie down for a few minutes, crush a 5 drop capsules and inhale it, and the symptoms will disappear in a few minutes.

These Pearls supply a long felt want in the administration of this powerful remedial agent. A finely blown glass bulb is filled with a given quantity of the Amyl, each 2, 3, 5 and 8 drops, the glass is then drawn out and hermetically sealed. The patient who shall inhale it carries the Pearls in a little box, and at the approach of premonitory symptoms crushes one in a handkerchief and inhales the medicine: the glass is so very thin that the patient runs no danger whatever of wounding himself. The great advantage of this new contrivance is in the rapidity with which a correct dose of the Nitrite of Amyl can be administered by the patient himself, and in all cases of Asthma, Angina Pectoris, Epilepsy, or other diseases where this is essential, these glass Pearls form as yet the best known method of applying it.

Price, 2 and 3 drops, 75c. per doz.; 5 and 8 drops, $1.00 per doz.

Reichardt's Adjustable Brush Holding Rubber Stopple.

This is a tapering rubber stopple, closing the mouth of the vial tighter than ordinary corks, much more durable, impervious to Acid, Iodine, etc., and on account of its length and taper fitting equally well in bottles varying in size from ¼ to 6 ounces.

The lower or inner part of the stopple is provided with a tapering hole formed in it to receive the handle or quill of the brush so that whether the stopple is inserted in a bottle or removed from it the brush will be securely held by the stopple.

Put up 1 Dozen Assorted Sizes in a Box. For Sale Wholesale and Retail. **90c.** per dozen; **$10.00** per gross.

THE INEBRIATES' HOME, Fort Hamilton, L. I., N. Y.

(INCORPORATED 1866.)

President and Consulting Physician—THEODORE L. MASON, M.D., also President of the American Association for the Cure of Inebriates, and the Collegiate Department of the Long Island College Hospital. Attendant Physician—L. D. MASON.

The Buildings are constructed for this special purpose, and they are more complete, better furnished, and better adapted for the treatment of dipsomania than those of any other institution in existence.

The Management is systematic, thorough and adequate. There has been no change in the staff of medical or other active officers since the inauguration of the Home, nearly ten years ago.

The Classification is more perfect than, and the beneficial results are fully equal to, those of any other kindred institution.

Boarder Patients are classified according to accommodations required, and the charges are proportionately adjusted. Their departments are divided up into several floors, each containing such accommodations as the patients or their friends are willing to pay for. There are separate dining-rooms, lodging-rooms and parlors, billiard and bath-rooms. There is also a lecture-room for religious services, readings, concerts, etc. Several periodicals and daily papers are regularly taken. For the treatment of the better class of female patients an entire floor is set apart, handsomely furnished, having separate approaches, effectually isolating the sexes.

Remarkable Immunity from Death. The total death-rate since the opening has been one-half per cent., or one death for every two hundred patients. The total deaths of legitimate cases for treatment in the Home has been only one case in eight hundred during the same period. The rest were dying when admitted.

Patients are received either on their voluntary application, or by due process of law, and the powers of the charter to retain them within the limits of the grounds of the Institution are strictly enforced. For mode and terms of admission, apply to Rev. J. WILLETT, Secretary and Superintendent, at the Institution, Fort Hamilton (L. I.), N. Y.

FOOD for INFANTS and INVALIDS

THE

Health Food Company,

74 Fourth Ave., adjoining Stewart's,

NEW YORK,

Would call the attention of the Profession to their

Cold Blast (Attrition) Whole Wheat Flour,

AS AN ADJUNCT IN THE TREATMENT OF

INDIGESTION, CONSTIPATION, and MAL-NUTRITION.

This Flour represents all the Food Elements of the Wheat, the indigestible silex coat being first taken off, and the entire kernel, including the phosphates, etc., being reduced to fine flour by a new process, in which both the admixture of detritus from mill-stones and the injurious effects of heating the flour during preparation, are entirely avoided.

IT IS CHEAPER THAN WHITE FLOUR,

Because it contains nearly four times the amount of the Mineral Substances, for

NOURISHING THE NERVES, BONES, HAIR, AND TEETH.

ATTENTION IS ALSO DIRECTED TO OUR

WHITE WHEAT GLUTEN.

For *diabetes*, and for those requiring the Nitrogenous and Mineral portions of the Wheat, *without starch*. This, like the Whole Wheat Flour, can be made into Bread and Crackers, or may be taken in various ways, and often proves a very valuable remedy for the *Constipation* and *Dyspepsia* associated with many diseases. In excessive fatness, and in disturbed mental states, the Gluten (crude and purified) proves very serviceable.

Circulars, descriptive of these and other Health Foods, mailed to all applicants.

SHEDDEN'S FOODS

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

MEMBER OF THE AMERICAN MEDICAL COLLEGE ASSOCIATION.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878-1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures upon special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consist chiefly of Recitations from Text-Books. This term continues from the first of March until the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the Faculty. Regular clinics are also given in the Hospital and in the College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	25 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

DETROIT MEDICAL COLLEGE.

SESSIONS OF 1878-79.

FACULTY.

PRELIMINARY AND REGULAR SESSIONS.

EDWARD W. JENKS, M.D., President,
Professor of Medical and Surgical Diseases of Women, and Obstetrics.

GEORGE P. ANDREWS, M.D.,
Professor of Principles and Practice of Medicine and Clinical Medicine.

ALBERT B. LYONS, M.D.,
Professor of Chemistry and Toxicology.

THEODORE A. McGRAW, M.D., Treasurer,
Professor of Principles and Practice of Surgery and Clinical Surgery.

C. B. GILBERT, M.D.,
Professor of Materia Medica, Therapeutics, and Clinical Diseases of Children.

N. W. WEBBER, M.D.,
Professor of General and Descriptive Anatomy and Clinical Surgery.

LEARTUS CONNOR, M.D., Secretary
Professor of Physiology and Lecturer on Diseases of the Eye and Ear.

RECITATION SESSION.

H. O. WALKER, M.D.,
Lecturer on Genito-Urinary System and Rectum.

DANIEL LA FERTE, M.D.,
Demonstrator of Anatomy and Lecturer on Orthopedic Surgery and Tumors.

J. G. JOHNSON, M.D.,
Lecturer on Diseases of Mind and Nervous System.

J. H. CARSTENS, M.D.,
Lecturer on Differential Diagnosis.

E. L. SHURLY, M.D.,
Lecturer on Diseases of Throat and Lungs.

F. A. SPALDING, M.D.,
Lecturer on Diseases of Skin.

C. C. YEMANS, M.D.,
Lecturer on Chemistry.

JAS. D. MUNSON, M.D.,
Demonstrator of Practical Physiology.

E. A. CHAPOTON, M.D.,
Demonstrator of Practical Microscopy.

The Collegiate Year is divided into three sessions.

PRELIMINARY SESSION opens Wednesday, September 4th, 1878, and continues one month. The Clinics are held and the Lectures delivered by the Professors of the regular Faculty, and in the same order and frequency as during the Winter Term. Opportunity is given to dissect or work in the Chemical and Physiological Laboratories.

THE REGULAR SESSION opens Wednesday, October 2d, 1878, and continues five months. During this term all the branches of *General Medicine* and *Surgery*, both scientific and practical, are taught with care and thoroughness. All students are daily examined on the subjects of the lectures and on their dissecting and laboratory work.

Senior students have *daily practice* in the *art of examining patients*, in forming their own diagnosis, prognosis and treatment. As this is done under the direction of the professor holding each clinic, and in the presence of the class, it constitutes an invaluable course of training.

THE RECITATION SESSION begins second Wednesday in March, 1879, and continues four months. Daily during this term there will be held a lecture, recitation and one or two clinics. The lectures will be upon special subjects of medical or surgical interest.

The recitations will embrace the general subjects of the Regular Session, viz., Anatomy, Surgery, Midwifery, Diseases of Women, Physiology, Practice of Medicine, Materia Medica and Chemistry.

Though the Recitation and Preliminary Sessions are optional, it is hoped that all who can, will avail themselves of their manifest advantages in supplementing the regular winter course.

Three Hospitals—Harper's, St. Mary's and St. Luke's—with two large free dispensaries, afford an abundance of clinical material for illustrative and practical teaching.

All lectures are delivered on Hospital grounds. The *peculiar feature* of this school is the *intimate union* between its *laboratory*, *clinical* and *didactic* instruction.

FEES

FOR PRELIMINARY AND REGULAR SESSIONS:

Matriculation	$ 5 00
Hospital Fees	10 00
Lecture Fees	40 00
Graduation	25 00
Lecture Fees to third course students	25 00

For the Recitation Term the Lecture Fees are $10, to those who attend the other courses. All others are required to matriculate and take out the Hospital tickets.

All fees payable in advance to the *Secretary*.

Board and Rooms can be obtained at low rates—according to accommodations—from $3 to $5 per week. Announcement and Catalogue, or any further information which may be desired, can be promptly obtained by addressing

LEARTUS CONNOR, M.D., Secretary,
92 CASS STREET, DETROIT.

Official Announcements of the Medical Colleges of the U. S.

FEES.—Matriculation, $5.00. Faculty, $100.00. Perpetual Ticket, $100.00. Graduation Ticket, $25.00.

THOMAS F. ROCHESTER, M.D., Dean,
Buffalo, N. Y.

MIAMI MEDICAL COLLEGE

OF CINCINNATI.

Next Session will commence October 3d, 1878. Professors' Tickets, $40.00.

FACULTY.—JOHN A. MURPHY, M.D., Dean; E. WILLIAMS, M.D.; WM. CLENDENIN, M.D.; WM. H. TAYLOR, M.D.; J. B. HOUSE, M.D.; W. H. MUSSEY, M.D.; T. H. KEARNEY, M.D.; J. C. MACKENZIE, M.D.; W. B. DAVIS, M.D.; BYRON STANTON, M.D.

For Circulars, address, JOHN A. MURPHY, M.D., 168 W. 7th St.

STARLING MEDICAL COLLEGE,

COLUMBUS, OHIO.

The Thirty-second Session of Starling Medical College will begin October 2, 1878, and continue until March, 1879. It will be preceded by a preliminary course beginning September 4, 1878. Extensive additions have recently been made to the Museum and other teaching facilities of the College.

FACULTY.—F. Carter, M.D., Dean; H. G. Landis, M.D.; J. H. Pooley, M.D.; S. Loving, M.D.; J. M. Wheaton, M.D.; E. B. Fullerton, M.D.; W. J. Conklin, M.D. (of Dayton); Alex. Dunlap, M.D.; Otto Frankenberg, M.D.

Lecture tickets, including matriculation, $45.

College, cor. of State and Sixth Sts.; Dean's Office, 181 E. State St.

Letters of Inquiry should be addressed to the Dean.

FRANCIS CARTER, M.D., Dean, Columbus, Ohio.

CLEVELAND MEDICAL COLLEGE,

Cor. St. Clair and Erie Sts. Founded 1843.

FACULTY:—J. L. Cassels, M.D., LL.D.; Proctor Thayer, M.D.; H. K. Cushing, M.D.; John Bennitt, M.D., Dean; Jacob Lalor, M.D.; John E. Darby, M.D.; E. W. Morley, M.D.; Isaac N. Himes, M.D.; X. C. Scott, M.D.; B. W. Holliday, M.D.; Lewis Buffett, M.D.; H. H. Powell, M.D.; Jno. F. Isom, M.D.; W. W. Holliday, M.D.

FEES.—Lecture Tickets, including Matriculation Ticket, $50.00.

WINTER SESSION.—Commences on the third Wednesday in September, and continues 24 weeks.

SUMMER SESSION.—Commences on the first Monday in April.

H. H. POWELL, M.D., Secretary, 323 Euclid Avenue.

UNIVERSITY OF MICHIGAN.

DEPARTMENT OF MEDICINE AND SURGERY.

The 29th annual course of lectures will commence on Oct. 1, 1878, and continue *nine months*.

Course separate but equal for women.

Matriculation Fee, *paid but once*—Residents of Michigan, $10; non-residents, $25.

Annual Dues—Residents of Michigan, $20; non-residents, $25.

Graduation Fee—For all alike, $10.

Send for Circular and Catalogue.

A. B. PALMER, M.D., DEAN, Ann Arbor, Mich.

IOWA STATE UNIVERSITY,

IOWA CITY, IOWA.

MEDICAL DEPARTMENT.—SESSION OF 1878–79.

The next term will commence on Wednesday, October 9th, and continue until the first Wednesday in March, 1879. No preliminary course. Six lectures daily, including clinics at Mercy Hospital, to which there is free admission. Advanced students will be entrusted with the care of cases. Candidates will be required to perform operations upon the Cadaver. Dissecting and clinical material abundant. Requirements of the Am. Ass. of Med. Colleges strictly complied with.

FEES.—For the entire Course, $20.00. Matriculation Ticket, $5.00. Demonstrator's Ticket, $5.00. Examination Fee, $25.00. For circular or further information, address

W. F. PECK, M.D., Dean, Davenport, Iowa; or,
E. F. CLAPP, M.D., Sec'y, Iowa City, Iowa.

N. H. MEDICAL INSTITUTION AT DARTMOUTH COLLEGE.

The *Eighty-second* Annual Course of Lectures begins Aug. 1, 1878, and continues fourteen weeks. Recitations from Dec. 5 to June 20.

FACULTY:—E. R. Phelps, M.D., LL.D., Practice Emeritus; O. P. Hubbard, M.D., LL.D., Chemistry; J. Ordronaux, M.D., LL.D., Medical Jurisprudence; C. P. Frost, M.D., Practice; P. S. Conner, M.D., Surgery; E. S. Dunster, M.D., Gynecology and Obstetrics; H. M. Field, M.D., Therapeutics; L. B. How, M.D., Anatomy and Physiology.

FEES:—Matriculation, $5; Lectures, $77; Graduation, $25; Recitations, $40.

For Circular, address C. P. FROST, M.D., Dean, Hanover, N. H.

MEDICAL DEPARTMENT OF HARVARD UNIVERSITY,

BOSTON, MASS.

NINETY-FIFTH ANNUAL ANNOUNCEMENT. (1878–79.)

Instruction is given by Lectures, Recitations, Clinical Teaching, and Practical Exercises throughout the Academic year. The year begins Sept. 26th, 1878, and ends the last Wednesday in June, 1879. Persons who hold no degree in arts or science must pass an *examination for admission* to this School in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held in June both at Boston and at Cincinnati, in September at Boston only. Examination for advanced standing Sept. 23d.

A Catalogue, containing detailed information and specimens of examination papers, will be sent on addressing

DR. R. H. FITZ, Secretary, 108 Boylston St., Boston, Mass.

MEDICAL INSTITUTION OF YALE COLLEGE.

Spring Term begins February 14, and closes June 25, 1878.

Winter Term begins October 3, 1878; closes January 30, 1879.

FEES.—Matriculation Fee, $5.00. For the Spring Term, $60.00. Contingent Expenses of Laboratory, Spring Term, $10.00. Winter Term, Lecture Fee, $105. Demonstrator's Ticket, paid once a year by those who dissect, $5.00. Graduation Fee, $25.00.

For further information, address

CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.

(Medical Department of the Northwestern University.)

The Winter Session will commence on the first day of October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $50.00. Graduation Fee, $30.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $6.00.

All Fees are payable in advance to the Registrar, Prof. HOLLISTER.

Any further information that may be desired can be promptly obtained by addressing

J. H. HOLLISTER, M.D., Secretary and Registrar of the Faculty.
No. 73 Randolph Street, Chicago, Ill.

COLLEGE OF MEDICINE

(Medical Dept. Syracuse University),

SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar,
WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE,

337 and 339 S. Lincoln St., Chicago.

The *Ninth Annual Course of Lectures* will commence on Tuesday, October 2, 1878, and continue twenty-one weeks. College building new. Clinical and dissecting advantages unsurpassed.

FACULTY.—Wm. H. Byford, A.M., M.D., Pres., Obstetrics; T. D. Fitch, M.D., Sec'y, Gynecology; Chas. W. Earle, M.D., Treas., Diseases of Children; I. N. Danforth, M.D., Pathology; J. E. Owens, M.D., Surgery; Wm. E. Quine, M.D., Practice of Medicine; D. R. Brower, M.D., Therapeutics and Nervous Diseases; Sarah H. Stevenson, M.D., Cor. Sec'y, Physiology; D. W. Graham, A.M., M.D., Anatomy; Flym. S. Hayes, M.D., Chemistry.

For information or announcement, address either of the Secretaries, at 125 State St. W. H. BYFORD, A.M., M.D., Pres.

Official Announcements of the Medical Colleges of the U. S.

The Fourteenth Annual Course of Lectures in the

Medical Department of the University of Wooster,

LOCATED AT CLEVELAND, OHIO,

Will begin Wednesday, October 3d, 1878, and continue until the last Wednesday in February, 1879. Medical and Surgical Clinics, Monday and Tuesday, Thursday and Friday of each Week, at Charity Hospital. The Preliminary Term commences Sept. 19. The Summer Course of Recitations and Clinics begins April 2, 1878, and continues 12 weeks.

FACULTY:—G. C. E. WEBER, M.D., Dean; L. FIRESTONE, M.D., LL.D.; W. J. SCOTT, M.D.; H. J. HERRICK, M.D.; CONWAY NOBLE, Esq.; A. C. MILLER, M.D.; JOEL POMERENE, M.D.; D. B. SMITH, M.D.; H. W. BOUDAULT'S PEPSINE

In POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is sold in 1 ounce, 8 ounce, and 16 ounce bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France)

DRAGEES, ELIXIR, AND SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

Prepared by CLIN & CO., Pharmacists, Paris.

LA PLATA EXTRACT OF MEAT.

CH. DELACRE,
Sole Consignee,
IXELLES, BELGIUM.

Agents for the U. S.,
E. FOUGERA & CO.,
NEW YORK.

This Extract is a pure extract of Beef, prepared according to the improved process of Baron von Liebig, unsurpassed in quality, free from fat and gelatine, each pound of which contains the soluble nutritive constituents of 34 to 36 pounds of the finest beef, exclusive of bones and fat, corresponding to about 45 pounds of good butcher's meat. As a medicinal agent it will be found of great value to the sick, invalid, and persons and children of weak constitutions. ***It will keep unaltered for years in any climate.***

CAUTION.—Physicians wishing to use a pure extract of beef will do well to specify the ***"La Plata,"*** since it is never offered for sale until it has been analysed by Mr.

CH. DELACRE, Chemist, General Consignee at Brussels,

and found by him to possess the essential qualities of the best articles of this kind.

None genuine without the above trade-mark—*Bullock reclining.*

DOCTOR GIBERT'S

Depuratory Syrup and Dragees of Iodized Deuto-Iodide of Mercury

These preparations have been approved by the Academy of Medicine of Paris, and have been thoroughly tested in the hospitals of Paris in the treatment of *Syphilitic, Scrofulous* and other affections requiring the use of iodized remedies.

They are recommended for the utmost accuracy of composition, and their perfect preservation.

Prepared by VAUQUELIN-DESLAURIERS, Chemist, Paris.

E. FOUGERA & CO., Agents, New York.

F. G. OTTO & SONS'

STEAM ATOMIZER.

A is a cylinder (made of Russian iron) for the reception of a copper-bottom boiler, C, and an Alcohol lamp, B. D is the safety-valve, E the Glass spray tube, F the medicine cup, H the face shield, I is a split tube which slides on the upright K, by means of which the face shield may be lowered or raised at will. G is a glass cup, and serves as receiver for the drippings of the face shield.

DIRECTIONS FOR USE.

Unscrew the valve D, fill the boiler to about three-quarters of its capacity with water, and screw the valve D on securely; then light the Alcohol lamp B. When sufficient steam is generated, it will pass through the horizontal part of spray tube and blow over the perpendicular part, which will then suck up the medicine from the cup F, and will produce a very fine spray.

In placing this Steam Atomizer before the profession and public, we have tried and succeeded to make a perfect and at the same time a cheap and reliable instrument.

Price, $4.00.

THE PATENT SPIRAL SPRING RING PESSARY.

The engraving below shows the manner of manufacturing the Ring Pessary. In a spiral spring of brass spring wire about eight coils of thin rounded whalebone are inserted, which is bound loosely by the spiral spring, thus allowing the coils of whalebone to revolve around themselves, giving, as will readily be seen, more elasticity than they would were they bound tightly by a soft wire of any material, the ends of the spring are then screwed together, and the whole covered with soft rubber of exceedingly smooth surface. We manufacture in the above manner the Bow Pessary, Albert Smith's and all other shapes. *Manufactured only by*

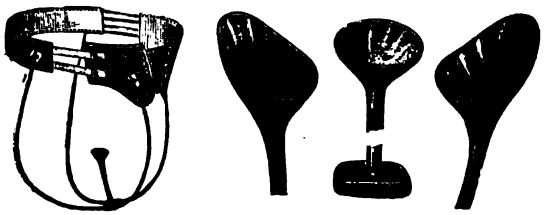
F.G.OTTO & SONS N.Y. PAT. JUNE 6. 1876.



DR. McINTOSH'S
NATURAL UTERINE SUPPORTER.

No instrument has ever been placed before the medical profession which has given such universal satisfaction. The combination is such that the Physician is able to meet every indication of Uterine Displacements. Falling Womb, Anteversion, Retroversion and Flexions are overcome by this instrument, where others fail: this is proven by the fact that since its introduction to the Profession it has come into more general use than all other instruments combined.

Among the many reasons which recommend this Supporter to the Physician is its self-adjusting qualities. The Physician after applying it need have no fear that he will be called in haste to remove or readjust it, as is often the case with rings and various pessaries held in position by pressure against the vaginal wall, as the patient can remove it at will and replace it without assistance.

The Abdominal Supporter is a broad morocco leather belt with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen. The Uterine Support is a cup and stem made of highly polished hard rubber, very light and durable, shaped to fit the neck of the womb, with openings for the secretions to pass out: as shown by the cuts. Cups are made with extended lips to correct flexions and versions of the womb.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, pass down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic adapt themselves to all the varying positions of the body and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Antiversion, Retroversion, or any Flexions of the womb, and is used by the leading physicians with never-failing success even in the most difficult cases.

Price—To Physicians, $8.00; to Patients, $12.00.

Instruments sent by mail, at our risk, on receipt of price, with 16 cents added for postage, or by Express, C.O.D.

PHYSICIAN'S SADDLE BAG.

This Bag is the most complete and durable Bag in the Market, and will give the best satisfaction to the Profession of any Bag ever offered. The Bag is entirely riveted with copper rivets, thereby doing away with the old style of sewing, which has been the great objection heretofore. The boxes containing the bottles are made of the best Tin Metal. A, is the metal box containing the bottles; B, is the box used to carry instruments, powders, etc.; C, is the flap, which holds the upper and lower boxes, A and B, firmly together, being fastened by a turn lock, which holds the contents in their place; D, represents the bag when closed. It is the only bag made that has a complete water-shed to prevent the contents from getting wet.

WHAT IS THE CELLULOID TRUSS?

It is composed of a steel spring, finely tempered and covered or encased with this compound, forced on under immense pressure without any seam, and quite as smooth as the finest polished Ivory. This material being entirely impervious to moisture or perspiration, the spring is completely protected and preserved from rust, thus rendering it perfectly indestructible.

The Pad is made of the same material and in different forms, and being hollow and perfectly smooth, renders it light, comfortable, and pleasant to the person. Unlike Hard Rubber, this coating is not liable to crack in cold weather, and needs no heating to fit it to the body, neither does it emit any sulphurous or unpleasant odor.

It does not chafe; will not break or rust; can be used in bathing; is cool and comfortable, always clean and good as new. Every Celluloid Truss is warranted.

We unhesitatingly pronounce the "Celluloid Truss" to be the most perfect instrument for the relief and cure of Hernia ever produced. Those afflicted should, without fail, examine this Truss before purchasing any other.

SOLD BY ALL LEADING DRUGGISTS AND DEALERS.

SOLE MANUFACTURERS OF THE CELLULOID TRUSS

(EXTRACT FROM JUDGES AWARD.)

The United States Centennial Commission has examined the report of Judges, and accepted the following reasons and decreed an award in conformity therewith:—

CELLULOID TRUSS.

Beyond comparison the Most Perfect Truss exhibited. For general excellency of material as a coating for Steel Springs, resisting perspiration, for beauty of finish, perfect workmanship and adaptability for all the purposes desired in this class of instruments.

JUDGES.—C. B. WHITE, M. D., United States; J. H. THOMPSON, A. M., M. D., United States; ERNEST VON FLEISCHEL, M. D., Vienna; WM. ROTH, M. D., Surgeon-General German Army.

BUFFALO LITHIA WATERS

FOR

Stone, Gravel, Diabetes, Hæmaturia

AND

Diseases generally of the Urinary and Genital Organs.

Stone in the Bladder and Hemorrhage from the Bladder.

Case of Mrs. ——, of Charlotte, N. C., stated by Dr. J. B. JONES, *of this place:*

"Mrs. —— suffered with stone in the bladder, composed of alternate, concentric layers of calcarious matter and lithic acid, attended with occasional alarming hemorrhage from the bladder. I prescribed for her the Buffalo Lithia Water, the continuous use of which arrested the formation of stone, and the hemorrhage occurs now at much longer intervals."

Dr. HUNTER McGUIRE, *Professor of Surgery in the Richmond, Va., Medical College:*

"I prescribe the Buffalo Lithia Water freely in my practice, and have found it invaluable as an alkaline diuretic."

Dr. HARVEY L. BYRD, *of Baltimore, late Professor of Diseases of Women and Children in the College of Physicians and Surgeons of Maryland:*

"In all inflammatory conditions of the Kidneys and Bladder, the Buffalo Lithia Waters may be regarded as well nigh specific. I have witnessed remarkable results from them in Hæmaturia and Gravel—in some cases of the latter affection which had resisted the best medical treatment and the most celebrated mineral waters of the country."

Dr. THOS P. ATKINSON, *of Danville, Va., at one time President of the State Medical Society:*

"In Gravel, Diabetes, Hæmaturia, Inflammation and Ulceration of the Bladder, and diseases generally of the Urinary Organs, the Buffalo Lithia Waters may be regarded as one of the most potent of known remedies. I have witnessed astonishing results from them in cases coming under this classification."

Dr. HENRY M. WILSON, *of Baltimore:*

(The "*experience*" to which Dr. W. refers as of "*such a positive character*," was the relief of an *aggravated* and *obstinate* case of *gravel*.—PROPRIETOR.)

"My experience in the use of the "Buffalo Lithia Springs Water" has not been large, *but it is of such a positive character*, that I do not hesitate to express my preference for it, as a diuretic, over all other waters I have ever used."

Dr. JOHN C. COLEMAN, *a retired Surgeon of the U. S. Navy, Scottsburg, Va.:*

"One of the most unmanageable and distressing cases of Gravel that ever came under my observation, after long resisting all medical treatment, was entirely relieved by the use of the Buffalo Lithia Waters for six weeks."

Dr. G. F. ADAMS, *of Baltimore:*

"The combined strength of half a dozen of the best diuretics in our Pharmacopœia will not produce as much urinary discharge in either Ascites, Hydrothorax or general Dropsy."

Dr. E. M. CAMPBELL, *of Abingdon, Va., a well known member of the State Medical Society:*

"I prescribed the Buffalo Lithia Springs Water for the most aggravated case of Hæmaturia that I have ever seen. A few bottles of the water produced a complete cure."

Dr. T. B. GREER, *of Rocky Mount, Franklin Co., Va.:*

"I have recently had occasion to try the 'Lithia Water' in a case of *Inflammation* and *Ulceration* of the bladder, caused by the retention of urine, the result of stricture of twenty years' standing. I had exhausted all of the resources, both of experience and authority, without relief, and when my patient commenced the use of it, had no hope of his recovery. He has been using the water five weeks, with results so favorable that he now has every prospect of complete recovery; and without some unexpected change in his condition, will be on his feet in a short time. The effects of the water in this case have been marvelous. For the sake of humanity I shall keep a record of the case, and report to you as it advances."

In a subsequent communication, Dr. GREER, referring to the above case, says:

"In the case of 'Inflammation and Ulceration of the Bladder," heretofore reported, the patient recovered, and I attribute the recovery entirely to the Lithia Water."

Dr. SILAS H. HARRIS, *of Clarksville, Va.:*

"The powers of this water are conspicuously displayed in removing those diseases of the male sex acquired by licentiousness and debauchery. Penetrating as it does every organ and every tissue of the human body, through the medium of the circulation, chronic disease of the kind referred to, and the scattered debris of old complaints, are hunted up and rooted out. The canker-worm of constitutional disease, which has been so long gnawing into his very vitals, impairing his manly energies, is made to loosen its poisonous fangs, and allow nature, unobstructed, to perform her work of reparation."

Dr. M. H. HOUSTON, *Physician to Randolph Macon College, Ashland Va.:*

"A gentleman far advanced in years labored under an irritation and inflammation of the neck of the bladder, so extreme as to render it necessary for him to make efforts to relieve it from twelve to twenty times during the night. Under the use of the water the relief was so complete as to render it necessary for him to rise only once, and often not at all during the night. As far as known, the relief thus afforded has been permanent."

These Waters, in cases of six gallons, may be had *at the Springs*, at $5 per case; or Caswell & Massey, cor. Broadway and 25th St.; Hegeman & Co., No. 203 Broadway, New York, at $6.50 per case. The Springs now open for visitors. Springs Pamphlet send to any address.

ANIMAL VACCINE VIRUS

OF THE

NEW YORK DISPENSARY.

The New York Dispensary Virus is as well-known if not better than any other Vaccine Virus in the United States, and it still continues to keep up its reputation.

Dr. N. A. Robbins succeeds Dr. Foster as Vaccine Director. Dr. Robbins is well known as a Vaccine Producer, and will maintain the standard of the Virus to its highest point. Liberal terms made with Druggists, Health Boards, and Public Institutions, etc.

Quill Slips (¼ quill charged at square cut end convex surface).....**$0.25.**
Capillary Tubes,..... .... **1.00.**

We would recommend Quill Slips as preferable, and in all cases of primary vaccination will fully guarantee.

Fresh supplies of Vaccine, every three days, can be obtained of New York Dispensary, Centre and White Streets.; at Laboratory, 94 Pineapple Street, Brooklyn; New York Hospital, West 15th Street, and of all the leading Druggists in the City.

NEW YORK DISPENSARY, Cor. Centre and White Sts., New York.

Drs. ROBBINS & LEWIS, 94 Pineapple Street, Brooklyn. *Quote* MEDICAL RECORD.

BOVINE VIRUS (RHODES').

This Animal Vaccine Virus, now used exclusively in the NORTH EASTERN DISPENSARY, is obtained in its purest form, under the immediate direction of Dr. WARREN SCHOONOVER, and is endorsed by many of our leading Physicians, such as Willard Parker, M.D., Professor of Clinical Surgery College of Physicians and Surgeons, New York City, and many others, and is offered to the profession the following rates:

One Quill Slip (charged in convex surface at square cut end), ***20 cents***
Seven " " " " " $1.00.
Crusts, (Humanized, first removal from heifer.) each, . . ***2.00.***

Each Quill is completely excluded from the action of the atmospheric air by a closely-fitting hermetically-sealed gutta percha covering, impervious to water or other destroying influence, and is guaranteed in all cases of primary vaccinations—if used in accordance with printed directions accompanying the same within eight days of their receipt. Should any fail, a second supply will be furnished gratis. All orders and letters of inquiry may be addressed to

W. SCHOONOVER, M.D., House Physician North Eastern Dispensary, 222 East 59th St., N. Y.

All orders by mail or telegraph, requiring dispatch, will be forwarded without delay, postage free. Remittance should accompany the order. A liberal discount, when used in large quantities, to Public Institutions, Health Boards, etc.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

K. & M.

Improved Extract of Malt.

Made from Canada Barley, selected, malted, dried, and extracted by, and under the immediate supervision of, Graduates of the Philadelphia College of Pharmacy. CONCENTRATED IN VACUO. This is as perfect an extract of the highest grade of carefully selected Barley Malt as can be PREPARED BY THE USE OF THE MOST IMPROVED VACUUM APPARATUS, recently designed for our own laboratory. As A FOOD in Syphilis, Typhoid and other fevers, Consumption and similar wasting diseases, it is without an equal for the rapid building up of a degenerate or depraved condition of the blood or tissues, since it acts not only as food itself, but its use converts and changes other kinds of food into a condition allowing easy assimilation.

We append the following letter from a gentleman well known to all:

MESSRS. KEASBEY & MATTISON: PHILADELPHIA, *September* 25, 1877.

Gentlemen.—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, *Secretary American Medical Association.*

K. & M.

Extract of Malt with Cod Liver Oil.

ORIGINATED BY KEASBEY & MATTISON.

THE MOST NUTRITIVE EMULSION EVER MADE.

Our Improved Extract of Malt, with 50 per cent. of our fine Norwegian Oil, is pre-eminently the emulsion of Cod Liver Oil, since it has double the nutritive effect of any other emulsion of oil. It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but, by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that it unites perfectly with water in any proportion, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Improved Extract of Malt with Pepsin.

This is our Improved Extract of Malt, with the addition of five grains of our Saccharated Pepsin to the tablespoonful. For dyspeptic disorders it is found of great value, since it digests both albuminoid and amylaceous matter, thus furnishing a preparation that is needed in the majority of cases of dyspepsia and other derangements of the stomach dependent upon the non-assimilation of the food.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Beef, Iron, and Wine, with Extract of Malt.

ORIGINATED BY KEASBEY & MATTISON.

A NOURISHING DIET FOR INVALIDS AND CONVALESCENTS.

As a simple restorative food, where a tonic effect is desired, there is perhaps nothing in the whole line of tonic dietetics of so much real value as this preparation. It furnishes the diseased stomach with the power of assimilating amylaceous diet, and supplies readily assimilable food at the same time, in the articles of Malt Extract. The iron salt supplies the red corpuscles that are deficient in the blood, while to the nutrient effect of beef is added the stimulant effect of a fine sherry wine. Each tablespoonful represents two grains of the soluble citrate of iron, and one ounce of finely-chopped raw lean beef, with equal quantities of our Improved Extract of Malt and sherry wine.

For sale by Druggists everywhere. Samples may be obtained of

Original Lectures.

LECTURES ON THE LOCALIZATION OF SPINAL AND CEREBRAL DISEASES.*

By E. C. SEGUIN, M.D.,

CLINICAL PROFESSOR OF DISEASES OF THE MIND AND NERVOUS SYSTEM IN THE COLLEGE OF PHYSICIANS AND SURGEONS, NEW YORK.

LECTURE IV.

2. NON-SYSTEMATIC OR FOCAL LESIONS OF THE SPINAL CORD CONTINUED; LESIONS INVOLVING ONE LATERAL HALF OF THE SPINAL CORD, IN ITS LOWER AND UPPER REGIONS; DIAGNOSIS OF SPINAL HEMIPLEGIA. ANATOMY AND DISEASES OF THE MEDULLA OBLONGATA.

GENTLEMEN:—When a focal lesion, caused by spontaneous disease, or by traumatism, involves one lateral half of the spinal cord more or less exactly, we observe striking and characteristic symptoms in the patient. Some of these are in relation to the height of the lesion in the organ as pointed out in the preceding lecture, but the most important ones are dependent upon the fact that one lateral half of the cord is injured in its kinesodic and æsthesodic tracts. A reference to Figures 2 and 4 in preceding lectures will facilitate the comprehension of what I shall have to say upon these lesions.

According as the lateral focal lesion is placed low down or high up in the spinal cord, we denominate the symptom-groups as hemi-paraplegia in the first case, spinal hemiplegia in the second.

a. Hemi-paraplegia. A tumor compressing one lateral half of the spinal cord in its dorsal (case by Charcot) or lumbar regions, a knife-cut, a contusion by a piece of broken vertebra, or a patch of hemorrhage or softening, will give rise to this symptom-group. Let us suppose the lesion to be situated in the right half of the spinal cord. As a result (see Fig. 2) the motor paths from the brain and upper spinal cord to the right lower extremity are cut off, together with the sensory paths which, crossing the median line below the lesion, supply the left lower extremity with sensibility.

In the living human subject we observe motor paralysis, more or less complete in the right lower extremity, and the sensibility of this member is preserved or increased. If the lesion be traumatic and quite complete, hyperæsthesia and increased temperature are present. In the left lower extremity, on the contrary, we find no paralysis, but more or less complete anæsthesia. It is noteworthy that the so-called muscular sense is not abolished in that anæsthetic limb. The bladder and rectum may be paralyzed. In some cases the distribution of symptoms in the two extremities is not as typical and clear as above stated, some paresis appearing on the side opposite the lesion, and slight loss of sensibility existing on the paralyzed side. This, I need hardly say, is owing to the fact that the lesion crosses the median line.

As regards constriction bands, increased reflex, nutrition of muscles, and visceral paralysis, regard must be had to the exact height of the lesion in the cord, as determined in sections 1, 2, 3 of the preceding lecture.

This form of paraplegia can be exactly reproduced in animals. It is now nearly thirty years since Brown-Séquard showed to the Biological Society of Paris, animals (Guinea-pigs, etc.), in whom hemi-paraplegia had been produced by cutting one lateral half of the cord in the dorsal region. The operation is not very difficult, and the results are always striking.

b. Spinal hemiplegia. A lateral focal lesion in the cervical enlargement, or above it, will give rise to the following symptoms, more or less exactly distributed. If the right half of the organ is the seat of the lesion, we observe that the arm and leg on the same side are paralyzed, the intercostals usually escaping, while on the opposite side there is no paralysis, but more or less perfect anæsthesia exists to the median line of the body, and as high as the limit of distribution of sensory nerves coming from the spinal cord just below the lesion. The absolute height of the lesion is to be determined as in sections 4 and 5 of Lecture III. In these cases we nearly always find, on the same side as the injury, contraction of the pupil, redness, and increased temperature of the face and ears. These symptoms are due to paralysis of the vaso-motor and ciliary centres in the spinal cord. Often the paralyzed limbs are hotter than the anæsthetic.

In some cases, owing to incomplete destruction of one lateral half of the cord, the arms, thorax, and face alone exhibit symptoms, the legs remaining normal. In other cases various degrees of abnormal reflex action are present in the affected lower limbs; sometimes more on the anæsthetic side.

We owe a clear conception of these interesting forms of spinal paralysis to Brown-Séquard, although some cases of spinal hemiplegia had been placed on record before him (Sir Chas. Bell, Ollivier, Oré, and others). This distinguished physiologist and physician produced spinal hemiplegia and hemi-paraplegia in animals from 1849 on, and in 1863–5 published elaborate memoirs, in which he collected all the cases then known, and critically studied their semeiology. In 1868 and 1869 the same author published other cases and remarks which have placed our knowledge of this subject upon a firm foundation. Some doubt exists as to the absolute correctness of Brown-Séquard's law of the course of motor and sensory paths in the spinal cord in animals, but in man it would seem, from the study of many cases, that the law holds good.

ANATOMY AND DISEASES OF THE MEDULLA OBLONGATA.

Leaving the diseases of the spinal cord to proceed to the consideration of those of the medulla oblongata, I must again refresh your memories upon the physiological anatomy of the parts concerned; mentioning only such data as will be of use to us in our diagnosis of location of disease. The first, and perhaps the most important point I wish to call your attention to is the decussation of the anterior pyramids at the junction of the spinal cord and medulla. This decussation is made up of bundles of nerve-fibres coming from the anterior pyramids of the medulla, crossing the median line, and continuing their way down the cord in each of its halves, constituting that part of the lateral column known as the crossed pyramidal column. Another bundle extends downward, without crossing the median line, into the inner part of the anterior columns, the so-called direct pyramidal column (compare Fig. 1., Lecture I.). According to the books, the uncrossed portion of the pyramidal fasciculus, the direct pyramidal column, is much smaller and less important than the other bundle of fibres which cross the median line.

Of immense importance for the study of localizations in the brain, and particularly for the estimation of the symptom hemiplegia, is a knowledge of the

* Delivered at the College of Physicians and Surgeons during the months of December, 1877, and January, 1878.

exact extent and regularity of this decussation, or more strictly speaking, semi-decussation. If we are to follow text-books we shall be led to believe that the semi decussation always occurs in about the same proportion on the two sides: a view which Brown-Séquard and others admit while trying to demonstrate that a lesion of the brain may produce paralysis on the same side of the body. Still, in past times a few facts had been recorded against the constancy of the pyramidal decussation, but it was not until Flechsig published his embryological researches in 1876, that it was known how *very variable* is this decussation. Examining the spinal cord of sixty fœtuses, this investigator found that the proportion in the size of the crossed and direct pyramidal columns varied almost infinitely between the following figures: in one case the direct pyramidal column was equal to 90, the crossed column to 10. In another case at the other extreme the proportion was 0 to 100; in other words all the pyramidal fibres had crossed the median line. There was no case in which there was absolutely no decussation, but Flechsig correctly remarks that there is no reason why such a specimen should not be met with. The majority of the fœtuses had an ordinary semi-decussation, the crossed bundle predominating over the direct. The above variations in the pyramidal decussation are diagrammatically represented in Fig. 5.

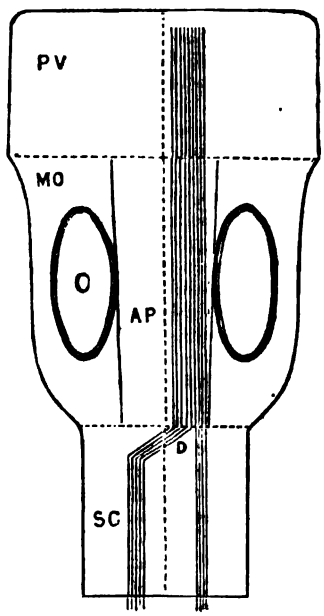

FIG. 5.

Diagram explicative of pyramidal decussation: P V, pons Varolii; M O, medulla oblongata; O, olivary body; A P, anterior pyramid; D, decussation; S C, spinal cord. The direct and crossed bundles vary very much in size, as shown in the following ratios of crossed and direct: 100:0, 92:8, 84:16, 70:30, 52:48, 35:65, 10:90.—(*Flechsig.*)

Besides, Flechsig determined that there were other irregularities in the proportionate size of the four columns (two crossed pyramidal columns, two direct) which result from the breaking up of the pyramids, but this is not essential to our present study.

The practical bearing of this discovery is very great, for it will be readily understood that in the exceptional cases in which the pyramidal decussation is nearly wanting, an unilateral lesion of the medulla, pons, or brain must give rise to symptoms of paralysis on the same side as the lesion.

Again, in those few cases in which the semi-decussation is nearly equal, an unilateral lesion above the spinal cord will produce weakness on both sides of the body. Lastly, in the immense majority of cases, those in which most of the pyramidal fibres cross the median line, we obtain the classical crossed hemiplegia. It is ignorance of these researches of Flechsig which makes that distinguished physiologist, Dr. Brown-Séquard, invert the reasoning and draw chaotic and iconoclastic conclusions respecting the mode of production of hemiplegia (and other symptoms of brain disease). Starting with the generally received doctrine (never proven in a scientific way) that the pyramidal decussation is invariable and nearly total, and finding scattered in medical literature more than three hundred cases in which paralytic symptoms appeared on the same site as the lesion, he concludes that we are all wrong in considering hemiplegia to be due to destruction of or pressure upon motor tracts in the brain and basis cerebri.

Bearing in mind Flechsig's demonstration, the erroneous logic of the above is evident. Besides, these exceptional cases, so laboriously collated, should be looked at in another way. Most of them are old cases, *i.e.*, cases reported before modern cerebral anatomy was understood; many of them are related by men utterly or relatively unknown. Furthermore, any one who has worked much in the post-mortem room will appreciate how easily right is wrongly written, when left is meant, as a brain is turned over and around for examination. Consequently, we might claim the right to reject as worthless many of these three hundred or more cases. Suppose, however, that they are accepted as *bona fide* examples of palsy on the same side as an encephalic lesion, and that we compare them with the thousands of cases of classical hemiplegia on the side opposite the cerebral lesion, do we obtain a proportion greater than that observed in Flechsig's series of fœtuses, one to sixty? I think not.

I have thus digressed from proper medulla diseases in order to treat the subject of pyramidal decussation fully, *i.e.*, anatomically and clinically, in one lecture. Having done this will save much repetition in treating of lesions above this point.

The pyramids whose decussation we have studied are the direct motor tracts which connect the cerebral cortex with the spinal cord. They are externally visible on the anterior (inferior) surface of the medulla, can be traced in the pons and crura, and thence into the internal capsule in the white centre of the hemispheres to those parts of the cerebral cortex which are now considered as in some way motor. In subsequent lectures I shall describe this great motor tract more fully, and give you the reasons for believing it to be continuous from the cortex to the end of the spinal cord. The remainder of the kinesodic system of the medulla embraces longitudinal bundles of fibres which lie between the two olivary bodies (supposed to be in connection with the ganglia at the base of the cerebrum) and the various nuclei of motor nerves in the floor of the fourth ventricle. These nuclei, or groups of motor (and trophic?) cells, represent the anterior horn-cells of the spinal cord, strangely thrown backward and toward the median line. They differ from the cell-groups of the anterior horns also in being more differentiated in relation to the nerves which arise from them. Reckoning from below upward, we find the nuclei of origin of the spinal accessory (11th), hypoglossal (12th), facial (7th), and abducens (6th) nerves. The last two lie on the confines of the medulla and pons. These nerves and their nuclei must, I think, be looked upon as active in three ways; 1, by their own (trophic?) neurility; 2, by reflex action

set up through the adjacent and correlated sensory nerves; 3, by impulses coming from supra-bulbar parts, great basal ganglia, cortex of the brain. This last connection is undoubtedly a crossed one, *i.e.*, the fibres or paths which transmit the motor impulse down to these nuclei cross the median line at some unknown distance above them. There is therefore another motor decussation besides the great one described above.

The æsthesodic system of the medulla oblongata occupies its lateral portions chiefly, and a part of the gray matter under the floor of the fourth ventricle, outside of the series of motor nuclei. In this gray matter we find, from below upward, the nuclei of origin of the pneumogastric (10th), glosso-pharyngeal (9th), and acoustic (8th) nerves. All through the lateral region of the medulla posterior to the olivary bodies lies the great descending root of the trigeminus (5th) nerve, which meets with groups of cells throughout this region down to the uppermost parts of the spinal cord.

These various nuclei and nerves, kinesodic and æsthesodic, make up arcs for reflex actions of the most important kind, as breathing, swallowing, and (with gray matter in the pons) the state of vascular tonus. The respiratory centre (so-called) is in the nuclei of the pneumogastrics, the vaso-motor centre lies near the median line at the junction of the medulla and pons, and there are various subordinate foci or centres for important morbid actions, as the diabetic centres, the albuminuric centre, etc. Besides, the hypoglossal nuclei and nerves preside over the movements of the chief organ of speech.

I should add that the medulla oblongata has intimate though ill-understood connections with the cerebellum, by means of the restiform bodies and olivary bodies.

As regards the localization of disease in the medulla, I shall have but little to say, for the reason that, in accordance with the terms of the course, I am bound to speak of only well-determined clinical forms whose lesions can be diagnosticated. Consequently, I will say nothing of systematic lesions in the bulbar æsthesodic system, nothing of bulbar lesions in diabetes mellitus, almost nothing of focal lesions of the organ.

a. Systematic lesions of the kinesodic tract are represented by only one typical symptom-group, viz.: the so-called labio-glosso-laryngeal paralysis, or bulbar paralysis. The lesion in this disease consists of granular degeneration of the ganglion cells of the nuclei of origin of the hypoglossus, spinal accessory, and of part of the facial nerves. The alteration is very like that present in progressive muscular atrophy (systematic lesions of the spinal cord, No. 5, Lecture III.), a molecular death, by degeneration, of ganglion cells.

The symptoms of typical labio-glosso-laryngeal paralysis are strictly motor, and consist in fibrillary contractions in and atrophic paralysis of the orbicularis oris, muscles of the tongue and throat, and some muscles of the larynx. Labial sounds are interfered with, saliva dribbles from the mouth, forcible blowing or whistling becomes impossible, the tongue plays heavily in the mouth as shown by thickness of speech and by difficult mastication, the voice becomes nasal through palatal paresis, and hoarseness, almost aphonia, is produced by palsy of the laryngeal muscles. At the same time, in extreme cases, the lower facial muscles become inert, the lower jaw hangs down, and an abundance of tenacious saliva runs from the patient's mouth; speech is quite unintelligible, and swallowing performed with extreme difficulty. At the close of life, if that be not cut short by the lodgment of food in the larynx, there are symptoms of injury to the pneumogastric nucleus, such as exceedingly rapid pulse and sudden stoppage of respiration.

In certain non-typical cases the lips, tongue and throat are affected in very various degrees; in others the pneumogastrics suffer early; and in others still the symptoms of progressive muscular atrophy, or of amyotrophic lateral sclerosis (Lecture II.) set in simultaneously or subsequently. I am disposed to believe that we may have many forms of "bulbar paralysis," and consequently would use the term as a generic one, to embrace certain varieties, only one of which is now well known.

[It will be asked why I do not speak at length of descending degeneration through the medulla. This lesion is the continuation downward of a degenerative change in the motor tract beginning in the cerebral cortex, the internal capsule, the nuclei of the corpus striatum, or in the basis cerebri.

It usually affects only one anterior pyramid, and is continued downward into the cord, in its direct and crossed pyramidal columns. No symptoms indicate this alteration in the medulla, and we infer its existence from the diagnosis of descending degeneration in the spinal cord (Section 3, Lecture II.). I do not formally treat of this systematic bulbar lesion for the reason that it has no semeiology.]

b. With respect to focal lesions. A lesion involving one lateral half of the medulla will produce, first, symptoms of injury to the kinesodic and æsthesodic systems in that half of the medulla, the symptoms being on the same side as the lesion; and second, hemiplegia of motion (and sensation, if the injury be deep enough) in the opposite side of the body. Again, a superficial focal lesion involving the anterior (inferior) face of the medulla may produce symptoms closely resembling those of bulbar paralysis of the type labio-glosso-laryngeal paralysis; and perhaps the only way of reaching a correct diagnosis is by determining the presence of the degeneration-reaction in the paralyzed facial and lingual muscles, and by demonstrating weakness or positive palsy of the extremities.

An exceedingly atypical form of bulbar paralysis is the one caused by ischæmia of the medulla, owing to arrest of circulation in the vertebral and anterior spinal arteries. The symptoms are mixed motor and sensory (deglutition and articulation impaired, breathing of the Cheyne-Stokes type, rapid pulse, tottering gait or marked general paralysis) and death rapidly ensues.

NATURE AND TREATMENT OF YELLOW FEVER.—The classical essay of Dr. Charles Belot, director of the hospital at Havana (Paris, 1865), will be remembered by many medical readers as a condensed experience of one who practised for years in one of the great yellow fever centres of this continent, and the translation just issued in Savannah of that remarkable paper will consequently find many subscribers. Dr. Belot regards the disease as having three distinct and well-marked stages, in the first of which the vomiting, at first clear, then greenish-yellow and loaded with mucous membrane, finally black and composed of clotted blood, makes its appearance at the expiration of a few hours. The urine is yellow or brown, and highly albuminous. The second period commences with the definite localization of the disease, and is marked by gastric pains, dyspnœa, swelling of the gums, and highly albuminous urine. The third or typhoid stage shows altered blood, diminution of heat, alteration of the nervous system, suppression of the urine, dyspnœa, and delirium.

TREATMENT OF THE VOMITING OF PREGNANCY.

By FREDERICK D. LENTE, M.D.,

SARATOGA SPRINGS, N. Y.

I HAVE just met with an article published by Dr. Sims in a recent number of the London *Lancet*, and republished in the April number of the Richmond and Louisville *Journal*, entitled the "Vomiting of Pregnancy and its Treatment," by M. O. Jones, M.D., of Chicago, on which I desire to make a few remarks.

In the first place, this affection is so distressing and generally so intractable, as the doctor justly remarks, that the profession ought to be grateful to him and to Doctor Sims for calling general attention to a mode of treatment, which, for a certain and rather large class of cases, is of signal service, acting generally as promptly as a full dose of quinine in ague. Dr. Jones refers to various opinions as to the pathology of this affection—"distention and development of the dense uterine structure," "flexions" (G. Hewitt and M. Brian), etc. He then refers to the long list of remedies which have been tried and found wanting. He mentions perhaps all remedies but the only one which has proved of any real service—electricity. In the first number of Beard's *Archives of Neurology and Electrology*, the writer published an article on the relief of vomiting by electricity, vomiting from various causes; but in several of the cases it was caused by uterine irritation, either during pregnancy or menstruation, for the latter sometimes produces as dangerous irritation of the stomach as the former. Other physicians have since tried this remedy with great success, notably Prof. Thomas, and I think it well to ask the attention of the profession anew to this matter, since the paper was published in a journal which had then but few readers. However, the subject was revived by a letter from Dr. Phillippo, of Kingston, Jamaica, to the writer, and published in THE MEDICAL RECORD two years ago. The case was that of a lady who had nearly lost her life from vomiting in two previous pregnancies, large quantities of blood having been evacuated from the stomach; the same symptoms were progressing when the doctor, having read my paper, concluded to try electricity. After the first application she could eat and relish chicken soup, and on the following day, chicken.

Dr. Jones believes that the irritation proceeds from the cervix uteri, and that the scientific treatment would therefore be to apply our remedies to that point. He says: "I thought, by exciting an irritation or superficial inflammation of the os and cervix uteri, the reflex nervous phenomena would be concentrated at the point of irritation, and thereby relieve the stomach." A very reasonable conclusion. He states that, immediately on the conception of this idea, he determined to put it into practice, which he soon did. This was six years ago. His method for producing the desired irritation is to apply the solid nitrate of silver to the os, and sometimes to the cervix also. The relief was prompt, almost immediate. All of his five cases but one were primiparæ. In two, there was "slight erosion around the mucous lining of the os," in the others no perceptible disease.

Dr. Sims relates, as a sequel to Dr. Jones's paper, a similar case which lately occurred in his practice abroad. The lady had had one child after going through a fearful amount of suffering and danger from vomiting. She had had three miscarriages from the effects of gastric irritation, although attended by the best medical skill. She was now only a few days advanced in pregnancy, and Dr. Sims tried various remedies, including bismuth and potassium bromide, the latter in large doses. She rapidly grew worse, and on examination he found "right lateral acute flexion, both lips of the *os tincæ* granular, and covered with a profuse gelatinous leucorrhœal secretion. The os had been lacerated bilaterally, the anterior lip was everted as well as eroded, and the finger could easily have been carried into the canal." "I cleared away the leucorrhœal secretion, and applied a solution of nitrate of silver (℥ ij. a ℈ i.) freely over the whole surface of the os until it was well whitened. On the next day I found M. de C. sitting up in bed, and as bright and cheerful as possible. The change in her voice and general appearance was marvellous; she had taken a liberal breakfast, the first in two weeks. At the end of five or six days there was some nausea, and I pencilled the neck of the womb with pure carbolic acid. On the next day, she said she was perfectly well." This was all the treatment that was necessary.

I have always considered this idea of the pathology of the affection, enunciated by Dr. Jones, as the correct one, and it is, I believe, the opinion of the majority of the profession. If the opinion of G. Hewitt and M. Brian were correct, the vomiting would not persist after the fifth month; but we know that, in many if not in all these desperate cases which we are now considering, it does persist to death, which has occurred in several cases, or to the evacuation of the uterus. There is no doubt, however, that the irritation of flexion does, like any other source of irritation, cause the phenomena in the earlier months of gestation. Unfortunately, and singularly, Dr. Jones fails to give us the date of conception and the date at which the treatment effected the cure. In his cases, there was apparently not enough disease to cause such symptoms; but, in Dr. Sims's case and in my own there was chronic disease, and I have always had the idea that it was the effect of the application on this disease, blunting the sensitiveness of the irritated nerve filiments, which gave the relief. I have been struck with the prompt relief of hemorrhage, and occasionally of severe vomiting, and of nervous symptoms, by one or two thorough applications of the solid nitrate of silver to the whole lining of the uterine mucous membrane; by means of my *porte caustique*, and also of the same symptoms by a single application of the *curette* to the same surface, although almost nothing was scraped away. Some writers contend that, in the latter case, it is the induction of a new action, a new irritation or inflammation, which produces the prompt effect. But it is sufficient for our present purpose to know that the nitrate and the curette have this power, without knowing precisely how it is exerted.

The first case in which I applied Dr. Jones's treatment occurred thirteen or fourteen years ago, and I think it may have been published in one of my papers, but cannot recall the name of the journal nor the date. The patient was the wife of a non-commissioned officer at West Point. She had arrived, if my memory does not fail me, at the seventh month of gestation, when the vomiting, which had persisted for months, became alarming. No nourishment or stimulant of any kind, or in the smallest quantity, could be retained on the stomach. She had suffered from leucorrhœa for a long time, and vaginal examination revealed granular erosion and dilatation of the os, with a purulent discharge from it. The os and cer-

vical canal were freely touched with the solid nitrate. It happened that I could not visit the patient for several days, and when I did, I found her, to my great surprise, whitewashing the room. She had been almost immediately relieved of her bad symptoms, and her ability to take food returned at once. I have an indistinct recollection of a case published a year or so ago, in which the vomiting was so severe and dangerous, that a sponge-tent was introduced with a view to produce abortion. It failed in its object, but the sickness did not recur, and the patient went on to full term. The physician accordingly recommended this form of irritation in similar cases. Prof. Thomas recalled my attention to this case, but neither of us could remember the name of the reporter of the case. Such treatment would, as he remarked, induce abortion in a large majority of cases.

Since the application of *electricity* to these cases, I have never found it necessary to resort to uterine applications. But they do not occur frequently in the practice of most men, and I have had but very few opportunities to test it myself; but my friend Prof. T. G. Thomas, who commenced its use immediately after the publication of my paper in November, 1874, has had a fair field for trial in his extensive personal and consultation practice, and writes to me on the subject as follows:

"In reply to your question as to my experience in the use of the electric current in the relief of nausea and vomiting, I would state that I have, ever since the appearance of your paper calling attention to its efficacy, employed it very extensively. In that distressing and very obstinate gastric disturbance which so often shows itself after ovariotomy, I have found it especially advantageous.

"I employ it in a manner somewhat different from yours. Fixing one broad, flat electrode by means of broad strips of adhesive plaster on the epigastrium, and placing a similar one under the spine (the patient lying on the back), I pass a current so gentle that the patient is just conscious of its passage. This I continue steadily for ten, twelve, or even twenty-four hours without intermission, renewing the fluid in the battery whenever this becomes exhausted.

"This plan I have pursued with great advantage in a dozen cases or more, and have seen no evil result from it thus far. I know of no other therapeutic agent which I esteem so highly for the relief of nausea and vomiting as I do the electric current.

"I was led to adopt the prolonged gentle current from the fact that I have for a long time employed it in my own person for relief of muscular rheumatism, from which, you know, I suffer a great deal. Fixing the electrodes as I have described, upon retiring at night, at the attachments of the affected muscle, I allow a gentle current to pass until the next morning."

Dr. Thomas makes a very convenient electrode for the above purpose by stitching a flat sponge to sheet rubber.

Dr. Semmola * has lately recommended the *constant* current for "nervous vomiting," and reports excellent results for some years. He also finds it a valuable means of diagnosis in chronic vomiting. "In cases where the vomiting is not exclusively and primarily nervous, its application fails in enabling the stomach to retain food."

I find in the January, 1878, number of the *Am. Jour. Med. Sci.*, a number of cases reported by Dr. Busey, of Washington, where the most obstinate vomiting in pregnancy was cured promptly, after failure of other means, by the injection, *per rectum*, of large doses of bromide of potassium. Dr. Sims tried large doses in his case by the mouth ineffectually. In those less severe cases, where life is not threatened, but where it is rendered miserable by almost constant nausea, I have found the bromide very valuable, but have usually employed it, *per orem*, in moderate doses, and in combination with small doses of chloroform, and also with bismuth, repeating the dose every two, four, or six hours, according to the urgency of the trouble. The bromide is valuable both as a prophylactic against vomiting and as a cure. By getting the system under its full influence before anæsthesia by ether, and before going to sea, the distressing consequences of these disagreeable necessities are, in a great measure, avoided.

THE INFANTILE DIARRHŒA OF SUMMER.

BY C. G. COMEGYS, M.D.,

LECTURER ON CLINICAL MEDICINE, CINCINNATI HOSPITAL.

THE presentation of this subject by Dr. J. Lewis Smith, and its discussion in the New York Academy of Medicine, on the 16th of April, as reported in the RECORD in a previous number, greatly interested me, for the readers of the RECORD will please recall that in the issue for July 29, 1876, I published an article on "Cool Bathing in Inflammatory Bowel Affections."

Considering the season upon which we are now entering, and the very large destruction of life by bowel affections that ordinarily occurs during its infantile period, I think we must all admit that no medical topic possesses an equal interest to that which Dr. Smith has introduced.

I also published an article on my method of treatment in the *Philadelphia Medical Times*, July 19, 1875. I shall therefore merely reproduce in a condensed form what I have said in both of my articles.

It is only barely necessary to call attention to the difference between cholera infantum, and the more common forms of infantile diarrhœa comprehended under the common name of "summer complaint." In the former we have those profuse discharges of serous matter, by vomiting and purging, that bring on a collapse as rapidly as is seen in true Asiatic cholera; but the latter is slower in its progress, and commonly there is fever, due to a congestive or an inflammatory process in the small and large intestine.

I will in a general way put summer complaint in three classes. First, a condition of loose bowels—semi-fluid, greenish, watery, with some fæcal and half-digested matters and with slight elevation of temperature. In this stage the physician is rarely called, for every one attempts to treat it with some kind of diarrhœa mixture. We are only called when the case presents more dangerous aspects. 2. It may change suddenly to the clear, copious discharge of rice-water, and assume all the traits of cholera infantum; or 3, an inflammatory process is set up—enterocolitis, in which the discharges are more frequent, retaining, however, more or less the traits of the "loose bowels" described above, with the addition of a high fever—102.5° to 106°. The pulse is much more frequent—130–150; the mouth is dry, the thirst intense; eyes staring, contracted pupils; insomnia, vomiting, rolling of the head, and distressing cries due to hyper-

æmia of the cerebral vessels and the unappeased thirst. The frequent vomiting and diarrhœa inhibit digestion or absorption of nutritious substances, and the brain is imperilled, for an effusion is impending, and general collapse. In this alarming condition the greatest relief may be found in immersions of the body in cool or even cold water, from twelve to fifteen minutes, every three hours until the fierce symptoms are relieved, and relief will positively be obtained. It has now been five years since I have adopted this method of treating enterocolitis, and I have not lost a patient. This may seem to be a strong statement, but it is literally true.

I fell upon this method of treatment by accident in this wise: I was treating a child of eighteen months, with a high grade of fever. The case had progressed for some time with no amendment. I asked a consultation, and our united counsels did not change the case for the better. The fever continued, the brain had become involved, and there seemed to be no hope. With a feeling of anger at the unmitigated fever, I determined to subdue it at all hazards. I placed the patient slowly (for the contact of cold aroused distressing cries) in a tub of hydrant water (75°), and immersed him up to his neck, holding his head in the hollow of my hand, while I poured from a small pitcher cistern water (65°) continuously over the scalp. I kept him in the water twelve minutes, giving freely cool water for his intense thirst. Upon his withdrawal he was bluish, shivering, and nearly pulseless; the jaws trembled with the cold. He was wrapped unwiped in a woollen shawl, and soon fell into a most peaceful sleep; the skin had lost its burning heat, and a reaction soon set in; a healthy warmth and gentle perspiration were established, and the diarrhœa was arrested. The baths were repeated several times after this. In the meanwhile quinine and whiskey were given freely, also beef-tea and cool milk, with addition of lime-water. Subnitrate of bismuth and pepsin mixed in powders were administered during convalescence to restrain diarrhœa, and to assist digestion, until the suffering mucous coat of the alimentary tract should be entirely relieved. The recovery was complete.

From my experience in a large number of cases, I have the utmost confidence in recommending the plan of cold baths to the profession. I beg gentlemen to try it.

Not only will it be found invaluable in "summer complaint," but in pneumonia, capillary bronchitis, and scarlet fever, remitting and typhoid fevers; in short, whatever may be the disease (sun-stroke, *par excellence*), where a high fever exists.

If the limits of an article like this would allow it, I could give numerous cases, in all the febrile forms of disease enumerated above, where the most satisfactory results have followed baths.

The immersion plan is much better than the wet pack, because the radiation of the febrile heat is more rapid and equable from the surface of the body. I have used the pack about the chest and abdomen for many years in private and hospital practice, and I know well what I say when I repeat that it is not only more troublesome to apply, but of greatly inferior value to the immersion method. I have also in high grades of fever often enveloped the whole body in a wet sheet wrung out of cold—even ice water, but it does not answer an antipyretic purpose anything like as well as immersion.

In regard to the internal treatment, generally I employ blue-mass in powder with sugar, or rubbed up with the aromatic syrup of rhubarb, in order to establish the healthy yellow alvine dejection; afterwards bismuth and pepsin. I generally succeed with these in the apyretic or non-inflammatory cases, but give the bath always in enterocolitis.

In cholera infantum, I at once employ a suitable dose of morphia hypodermically, and at the same time give small and repeated doses of calomel or blue-mass to excite a biliary flux. The morphine will promptly arrest the vomiting and diarrhœa, but they will return with fatal effects unless the biliary dejections are established.

Lastly, children who have had an attack of summer diarrhœa and have recovered should be removed to places of better air and fresher diet, for they are exceedingly liable to a relapse.

I beg further space, in order to encourage practitioners to try the plan of cool baths, to quote from an editorial of Prof. H. C. Wood, in *Philadelphia Med. Times*, August 5, 1876, on the subject. Referring to my original article published in 1875, he says: "Any one who has seen, as I have this summer, the child on whom drugs had ceased to act, and who was seemingly doomed to die, relieved in twelve hours by enforced cold bathing every three or four hours, will grant to Dr. Comegys the credit of having introduced one of the most life-saving improvements in modern therapeutics. The sudden sweet sleep, replacing, after the bath, the fretful nights and days of unrest, is a thing never to be forgotten when once seen; and the arrest of the diarrhœa is certainly no less remarkable."

Dr. Fothergill, in his work, refers to my treatment, but seems to apprehend that it is only applicable to a form of enterocolitis. He is in error—it applies to all forms.

This summer I have tried salicylate of soda in the height of the fever, and I think it is of value. I also employ it in pneumonia very favorably.

CINCINNATI, O., June 4th.

Progress of Medical Science.

HERNIA TREATED BY HEATON'S METHOD.—Dr. Langmaid recently presented before the Boston Society for Medical Improvement two children on whom he had operated for hernia by the injection method of Heaton. Case I., Leo, aged four years, suffered from acquired scrotal hernia. Was operated on twice at intervals of about three weeks, but the hernia returned, it is believed, from the impossibility of keeping the bandage in place. A third operation was performed, three hours after which the hernia again returned and could not be reduced. Three days later it was found to have disappeared of itself, and there is now (six weeks after the operation) a dense, firm plug of plastic lymph, (?) filling the inguinal canal, and apparently keeping back the hernia. Case II., aged three years, was operated on for double congenital inguinal hernia. There was in this case considerable inflammation, and a severe epididymitis of the right side, due to the needle having been passed through the invaginated scrotum. In this, as in the previous case, the inguinal canals are filled by plugs, on the right side accompanying the cord nearly to the bottom of the scrotum. The herniæ have not returned. In answer to Dr. Bigelow, Dr. Langmaid said that the nature of the fluid injected governs the amount of inflammation. There had been but a single occasion when the inflammation had been at all great. Dr. Bradford

said that Englisch, of Vienna, injects alcohol, a still greater irritant than white-oak bark. His experiments had been carried on quite independently of those of Heaton.—*The Boston Medical and Surgical Journal*, May 2, 1878.

URINARY CASTS, AND THE MINUTE ANATOMY OF THE KIDNEY.—At a meeting of the Royal Medical and Chirurgical Society, Dr. Reginald Southey read a paper on some minute points in the anatomy of the kidney and their relation to the pathological feature of urinary casts. Reviewing the continuous system of urinary tubules, which was first described by himself, he called attention to the position and size of the looped tubes of Henle. These, the smallest of all the urinary tubes, are situated between the secreting and collecting systems, and are the sole means of communication between them. If this were borne in mind, it would be obvious that anything like a desquamative shedding of epithelium from the secreting tubes could not pass into the collecting tubes. Further, the shape and size of all casts were found to correspond with the excretory system of renal tubuli. Their most fertile source Dr. Southey believed to be the collecting tubes or the ascending straight tubes of the third subdivision; the largest old fatty granular casts were doubtless moulded in the gathering mains close to the orifices of the papillæ. After many years' vain search, nothing like a desquamative shedding of the epithelium lining a tortuous tube had ever been observed by the author; and actual linings of the straight collecting tubes with their low sessile columnar epithelium had, as such, never been recognized by him. In discussing the subject, Dr. George Johnson differed from Dr. Southey on a number of points. He considered that the evidence of the formation of casts in the convoluted tubes was indisputable. As for our knowledge of the minute anatomy of the kidney, it had not been proved that all the convoluted tubes passed into Henle's loops, and Dr. Johnson thought this was a matter of some doubt.—*The British Medical Journal*, April 27, 1878.

CLUB-FOOT.—Mr. Swan, of Dublin, has tabulated and analyzed forty cases of club-foot; twenty-six were equino-varus, the form most commonly met with, and of these, eighteen had been unsuccessfully treated before falling into his hands. The causes which led to this want of success, he places under three heads: 1. Removal of forces producing deformity in improper order. 2. Transfixion of tendons, or omission to divide a tendon which should have been divided. 3. Improper application of extension. Deficient time allotted to the subsequent treatment. The application of improper retaining apparatus. In six cases of the eighteen the tendo Achillis, and tibialis anticus were divided in conjunction; in three the tendo Achillis and plantar fascia; in four the tendo Achillis alone. Transfixion of a tendon may be inferred when—1. Point-pressure below site of attempted division produces spasmodic contraction of muscle. 2. Extension is performed slowly and with difficulty; the deformed position is resumed with a spring on suddenly withdrawing extension by hand. The posterior tibial tendon was divided in but two cases, although all of them required it. Extension may cause slough from pressure, or paralysis from too rapid extension of a muscle. The apparatus employed is sometimes deceptively efficacious, as when inversion of the toes is overcome by rotation outward of the entire limb. Plaster-of-Paris forms an excellent dressing to maintain the foot in position; but whatever retaining apparatus may be used it should be removed daily for the purpose of manipulation. Acquired valgus is common among those who are obliged to stand much: it is characterized by pain, either gnawing and dull, or lancinating and occasionally violent. There is a remarkable connection between acquired valgus and lateral spinal curvature, especially in young females. This may be due to the formation of a series of compensatory curves, or the existence of a peculiar diathesis as a predisposing cause.—*The Medical Press and Circular*, April 24, 1878.

DISEASE OF THE LENTICULAR GANGLION.—In a paper on this subject, Dr. J. Hutchinson stated that the destruction of this ganglion by disease might properly be followed by paralysis of three distinct muscular structures, the dilator of the pupil, the constrictor of the pupil, and the ciliary muscle. For this condition, involving paralysis of all the muscular structures within the eyeball, the term ophthalmoplegia interna was suggested, while that of ophthalmoplegia externa was proposed in contradistinction for cases in which all or most of the muscles moving the eyeball were involved. His conjecture was that when opthalmoplegia interna alone existed, the disease was in all probability in the lenticular ganglion itself. If the nucleus or any part of the trunk of the third nerve were diseased, and this paralyzing the constrictor of the pupil, there must necessarily be defect in some of the external muscles of the eyeball. The details of eight cases were then related. It appeared highly probable that, in most, syphilis was the remote cause. Attention was especially asked to the fact that in many cases the paralysis of the iris preceded that of the ciliary muscle, and almost always in excess of it; and further that, under treatment, the ciliary muscle might regain its power whilst the iridoplegia persisted. In no case was failure of accommodation the first symptom. A suggestion was made as to the possible association of this group of symptoms with the early stage of locomotor ataxy, especially with that form of it which appears to be connected with syphilis. —*The British Medical Journal*, April 27, 1878.

VEGETABLE PARASITES OF THE SKIN.—Dr. Edward Wigglesworth has studied the characteristics of the vegetable parasites of the skin by a series of inoculations upon himself, giving special attention to the question of their identity or non-identity. The following are the results he has obtained: I. All vegetable parasites of the skin are not inoculable at all times and upon all persons. II. Varying degrees of intensity, or duration of application, are needed for successful inoculation of different parasites upon the same skin; the severer cases requiring more thorough inoculation. III. A healthy skin may resist the action of the less severe but more widely-spread mycoses, but yields to the more thorough inoculation of the more severe and rare forms, showing that the resistant power of the soil furnished is a factor to be regarded. IV. Extension and intension are in inverse ratio to each other. The milder mycoses are the more common, and point to an origin upon skins below par in vigor. V. The various mycoses of the human integument possess each its own distinguishing characteristics, although a transitory stage of growth of one of them may, in rare cases, as in the "ringworm stage" of favus, simulate in appearance one of the forms, temporary or more permanent, of an apparently different species. VI. While botanical and clinical observations are so at variance in reference to the identity or non-identity of the mycoses, this question must be regarded as still undecided.—*Archives of Dermatology*, January, 1878.

LEGAL REGULATIONS FOR THE PRACTICE OF MEDICINE.

I.

THE necessity for regulating the practice of medicine by law has been so frequently discussed that we feel almost like apologizing for again bringing up the subject. We are convinced, however, that, notwithstanding repeated failures in accomplishing the desired result, some real progress has been made; and that, consequently, there is some hope for the future. With this conviction we propose to offer a few remarks upon the general topic, taking as the text thereof the present laws regulating the practice of physic in this State and county, and endeavoring to suggest such improvements to them as may be of practical service, not only to such as are more directly interested, but to the profession at large. We do not pretend to offer any excuse for selecting New York laws in this connection, inasmuch as, theoretically and practically speaking, they may be considered as a fair expression of the present state of popular feeling upon the subject, after much hard and persistent fighting on the part of the profession. Indeed, this statement would appear to be unnecessary, except for the suspicion that might arise in the minds of many of our readers that the discussion is merely of local interest.

The physicians and surgeons of the city and county of New York are subject to the laws of the State referring to medical matters; to the rules and regulations granted by the Legislature to the State and county medical societies; and to some of the provisions of the sanitary code of the Board of Health of this city.

No one can legally practise physic or surgery unless he or she shall have a diploma from some incorporated college of medicine of this State, or the degree of Doctor of Medicine from the Regents of the University, or a license or diploma, or certificate of membership, or of qualification, from one of the incorporated State, district, or county medical societies in this State.

No person coming from another State or county shall practise physic or surgery in this State or county until he shall have exhibited to the medical society of the county in which he resides satisfactory evidence that he has regularly studied physic and surgery, and shall have been duly authorized to practise by the laws of some other State or county, and have a diploma from some incorporated college of medicine, or legally incorporated medical society in such State or county.

According to Section 5 of the Sanitary Code of the Board of Health of this city, which we presume is authoritative, we learn that "the word physician shall include every person who practises about the cure of the sick or injured, or who has charge of, or professionally prescribes for any person sick, injured, or diseased, and any person who pursues the business of, *or acts as midwife.* Every physician in this city shall at all times cause his or her name, office and residence, and also his or her kind or class of practice to be registered within the Bureau of Vital Statistics and in a manner according to the regulations prescribed by this Board.

Every physician of temperate habits, good moral character and legally acknowledged right to practise physic and surgery in this State, is entitled to and must become a member of the medical society of the county in which he resides and practises.

When there was only one incorporated county medical society in each county of this State, all legally qualified practitioners of good moral character were entitled to, and obliged to become members of it; but as there are now both State and county homœopathic and eclectic medical societies, all physicians who practise avowedly according to those systems or methods are no longer entitled to, nor can they obtain membership in the medical societies of the State or counties of New York; nor should they in the homœopathic or eclectic societies, unless legally qualified and of good moral character.

If any county medical society shall neglect to perform all such acts as may be required to be done by it, by the law incorporating medical societies, or any other law of the State relative to the science of medicine, or shall do acts which may be considered derogatory to the honor of the medical profession, or shall oppose or neglect to comply with the by-laws of the Medical Society of the State of New York, it shall be admonished touching any such proceedings; and if it is deemed necessary for the public good that, from the improper conduct of any such county medical society, its corporate rights should be suspended, then in that case it shall be lawful and just for the State Medical Society to make application to the honorable the Legislature for such purposes.

The president of every county medical society shall give notice to every legally qualified and honorable physician and surgeon not already admitted into such society, requiring him or her within sixty days after the service of such notice, to apply for a certificate of admission as a member of such society.

The law of 1874, which is now in force, also says:

"Every practitioner of medicine or surgery in this State, excepting licentiates or graduates of some incorporated medical society or chartered medical school [of this State?] shall be required, and they are hereby commanded to obtain a certificate from the censors of some one of the several county, district or State medical societies [of this State], which certificate shall set forth that said censors have found the person to whom it is issued qualified to practise all the branches of the medical art mentioned in it [viz., physic, surgery, or midwifery].

"If a person apply to a county medical society for a certificate, and it be refused [on account of the ignorance, incompetence, or immorality of the applicant], he cannot apply to any other county medical society, not even to the homœopathic or eclectic, but has the right to appeal from the censors of such society to the medical society of the State in which such county medical society is represented.

"If a person applies to the Medical Society of the State for a certificate, and is refused, he is prohibited from applying afterwards to any county [or other State?] medical society; though, if he should subsequently and legally procure a diploma from any incorporated medical school or college, he would be allowed to practise.

"The homœopathic and eclectic medical colleges cannot legally issue a diploma to any one who has not studied medicine three years, and taken two full courses of medical lectures, and who is not of good moral character. The law of 1874, against diplomas illegally obtained, applies to all in which these requirements have not been fulfilled.

"And further be it enacted: That no physician or surgeon who may have received his license from any other State or county, shall be permitted to practise physic or surgery in the State, unless he shall exhibit satisfactory testimony to three of the censors of the State Medical Society, that the course of medical instruction which he has pursued has been as full and complete as that which is required by either of the medical colleges [existing in 1825] of this State.

"And if not, he shall submit himself to an examination before the Censors of the State Medical Society, and shall be licensed to practise physic in this State, if found competent, and not otherwise.

"The censors of each medical society shall notify all practitioners of medicine and surgery of the terms and requirements of this act, and require such practitioners to appear and comply with this statute within thirty days. Upon failure to appear, such persons shall be deemed to be practising without authority, and guilty of a misdemeanor, subject to a fine of from $50 to $200 for the first offence, and to a fine of not less than $100, nor more than $500, or by imprisonment for not less than thirty days, or by both imprisonment and fine, for the second offence."

The president of the society giving the notification for examination is required to commence the proceedings authorized by the act—that is, to lay the charges before the District Attorney of the county in which his society is situated.

The censors must proceed to examine all physicians [surgeons and midwives?] who present themselves. If found proficient, they shall be entitled to a certificate, which is not a license, but merely a certificate of qualification allowing the holder to practise; and much less does such a certificate make the holder a member of the county medical society granting it, for it does not even qualify him or her to apply for membership in it.

A diploma illegally obtained will not entitle a person to practise, and it would seem, according to Ordronaux, from the authority given to the censors of the society by this act, that they alone are to determine the legality of such diplomas.

The censors may also call upon physicians having diplomas from regularly chartered medical schools or colleges, and may compel the production of such diplomas.

ARTIFICIAL BUTTER—ITS UNWHOLESOMENESS.

In a recent article in the *American Dairyman*, Mr. John Michels gives an account of the manufacture of artificial butter, which will not be very assuring to consumers of this so-called wholesome article. He very properly maintains that it is important, in estimating the dietetic value of oleomargarine as a substitute for butter, to take into account that it is manufactured from the fat of animals, and that during the whole process, from first to last, this fat is *never submitted to a higher temperature than* 120 *degrees Fahrenheit.* The fat oils are, therefore, merely liquefied or set free, and manipulated to have the general appearance of butter, but they are virtually still in a raw state when thus offered for human consumption. It would appear to follow, according to his view of the case, that germs of disease (or their equivalent), morbid secretions and embryos of parasites, are thus liable to be transferred in a living condition into the systems of those who make use of this substance. But, bad as this is, it is by no means the worst side of the picture which is presented to the oleomargaric devotees, for, added to other objections, is that of adulteration. The descent in the scale of this adulteration from pure butter to the commonest kinds of compressed fat is as easy as it is natural. Hence, we are not surprised at the following statement bearing upon the point:

"The prospectus of the companies states that the

caul fat of the ox only is used for making oleomargarine, but I have reason to believe that the refuse fat of at least one pork-packing establishment is used. Thus already a departure is made from the programme, and as the trade increases, fat of every description will probably be offered for sale, and even that from the carcases of diseased animals may be purchased without guilty knowledge by the managers."

Mr. Michels is willing, however, to enter into some compromise with the ambitious manufacturers and speaks as follows on the real utility of the compound:

"For cooking purposes oleomargarine appears to be an excellent substitute for any fat previously used, but I consider considerable risk is attached to its use in a raw state as table butter, and as such it should be rejected."

THE MICROPHONE IN DIAGNOSIS AND OTHER MATTERS.

INTELLIGENCE comes to us that Dr. Richardson, of London, has been experimenting with Prof. Hughes, the distinguished discoverer of the microphone, or sound-magnifier, in order to ascertain whether the apparatus can be applied to diagnostic purposes in auscultation of the lungs and heart. So far the results have not been very satisfactory, inasmuch as there is considerable difficulty in making the sounds, which are heard through the stethoscope, pass, in the form of electrical vibrations, to the ear. It is reasonable to expect, however, that a large number of the present difficulties may be overcome, and that we shall arrive at a point where the sounds, normal and abnormal, can not only be distinctly heard, and made more intense, but new ones raised to the level of accurate audition. If such be the case, auscultation may be studied from an entirely new standpoint, and a chance may be given to the younger auscultators for making brilliant reputations.

In fact, in this age of astounding discoveries, it is hardly unreasonable to expect any possibility from instruments. With an attachment of the microphone, telephone, and phonograph to the telegraph, students within reach of the stations might be furnished with lessons in practical auscultation, the character of which would shame the best-directed efforts of Clark, Flint, or Loomis, and the utility of which would transcend anything ever before attempted. When this shall have been accomplished, we will no longer be astonished at the possibility of looking through the skull for a congestion of the brain, of hunting with a crowbar for a urethral stricture, of demonstrating a spinal centre in the clitoris, of proving that antiseptic spray kills bacteria, or of discovering the real syphilitic corpuscle. But let us be patient.

THE REPORT OF THE SECTIONS.

IN consequence of the press of other material we are unable to complete in our present issue the reports of all the Sections of the American Medical Association. As it is, we have done our best to give the usual variety to our readers, and will strive to complete our report in our next.

Reviews and Notices of Books.

MEDICAL REGISTER FOR NEW YORK, NEW JERSEY, AND CONNECTICUT, 1878, 1879. W. T. WHITE, M.D., Editor. 12mo, pp. 212.

THIS annual, which commences the year from June 15th, again makes its welcome appearance, and again invites a favorable word of comment upon its general plan and make-up.

The volume is somewhat smaller than its predecessor, which is a recommendation in its favor. All the old features which have made the book so popular have been preserved, and there is the usual evidence of accuracy of lists of names and of items of information regarding medical societies and institutions. It would be impossible to detail the different matters which are treated of in the little volume, except in a general way to say that for the purposes for which it is intended it is scarcely susceptible of improvement. This statement carries with it well-deserved commendations for the editor, Dr. W. T. White. The work was issued promptly on the date promised, which is a circumstance sufficiently unusual with those of its class to deserve a passing allusion.

Reports of Societies.

AMERICAN MEDICAL ASSOCIATION.

REPORT OF SECTIONS.

SECTION ON OBSTETRICS AND DISEASES OF WOMEN AND CHILDREN.

DR. E. W. JENKS, of Detroit, Mich., Chairman.
DR. H. O. MARCY, of Cambridge, Mass., Secretary.

TUESDAY, JUNE 4TH—FIRST DAY.

The Section was called to order at 8 P.M., by the Chairman.

The first paper read was by DR. THEOPHILUS PARVIN, of Indiana, on

OVOTOMY.

Dr. Parvin applied the term ovotomy to any cutting operation for the removal of the ovum.

He recognized *six* varieties of ovotomy:—1. Abdominal. 2. Vaginal. 3. Uterine. 4. Abdomino-Cystic. 5. Abdomino-Uterine. 6. Abdomino-Vaginal.

To the last two varieties Dr. Parvin made special reference; the first four varieties being mentioned in order to make the classification complete.

Attention was first directed to the history of abdomino-uterine ovotomy, or Cæsarean section, and the opinions of standard authors were quoted with reference to the indications for the performance of the operation.

Reference was then made to the history of abdomino-vaginal ovotomy, or the operation which, by Dr. T. G. Thomas, of New York, had been named laparo-elytrotomy.

With reference to those operations and the opera-

tion of embryotomy, the following important questions were to be considered:

How far should abdomino-vaginal ovotomy supplant abdomino-uterine ovotomy, and how far should either take the place of embryotomy? The chief dangers attending the last two varieties of ovotomy were then considered, and the conclusion reached that, taking into consideration shock, hemorrhage, peritonitis, etc., the abdomino-vaginal operation would not be performed where the diameter of the pelvis was two and one-half inches. His closing words were as follows:

"Qualifying, therefore, as possibly must be done, some of the advantages claimed for abdomino-vaginal ovotomy, it still remains, and must remain until facts are adduced contradicting those of Drs. Thomas and Skene, one of the most important advances in obstetric surgery. But certainly the future will not see it performed, as Baudelocque did in a case where the antero-posterior diameter of the superior strait was about four inches; nor until the confirmation of fortunate results obtained by Thomas and Skene will it be generally resorted to when that diameter is two and one-half inches."

Dr. De L. Miller, of Chicago, concurred in the conclusions reached by Dr. Parvin.

Dr. J. C. Reeve, of Dayton, O., referred to the danger of wounding the bladder, and directed especial attention to such liability under the management of the *ordinary operator;* in the hands of *skilled* operators that liability might be very much reduced.

Dr. E. S. Dunster, of Ann Arbor, Mich., thought that the time had not yet arrived at which the status of abdomino-vaginal ovotomy, or Thomas's operation, could be determined. It was impossible to generalize from so small a series of cases as had been reported; but a sufficient number of successful cases had been gathered to warrant us in pursuing the subject still further.

As compared with Cæsarean section he was of the opinion that Dr. Thomas put somewhat a false estimate upon it. For, peeling up the peritoneum instead of cutting it, did not rid it of the danger of inflammation. Dr. Dunster thought that the danger of inflammation in Dr. Thomas's operation was entirely underestimated, but when it was coupled with the danger of cellulitis, the dangers of the operation were quite as great as those which followed Cæsarean section. It was possible that the future might place the operation upon nearly the same platform as that now occupied by ovariotomy, although we could never, as a matter of course, have the same amount of experience in its performance. Dr. Dunster believed that it would be prudent to reserve our decision in making an estimate of the value of the operation, and simply say that experience so far was encouraging, and was sufficient to warrant us in pursuing the investigation. He thought it had been proved that the dangers of the Cæsarean section had been overestimated, and that if the operation was performed earlier than it had usually been, probably better results than have been reported would be obtained.

Dr. Horatio R. Storer, of Newport, R. I., thought that the profession was not prepared, in want of farther evidence, to accept as a measure and indiscriminately follow the revival of an operation long ago known. So far, however, as directing attention to, or making new suggestions with reference to an old operation, very great service had been rendered to the profession by the report of cases such as had been given us by Dr. Thomas and Dr. Skene.

With reference to the Cæsarean section, the history of the cases in which it had hitherto been performed had been extremely faulty in many particulars. Not only had the operation been postponed until the woman was practically moribund, but sufficiently minute data had not been furnished with reference—

1. To the simple opening of the abdomen.

2. With reference to the treatment of the uterus after the incision had been made.

There was a great diversity of opinion among writers upon that point.

3. Operators had, in many instances, failed to properly auscultate the abdomen with the view of determining the seat of the placenta.

4. There was a material difference of opinion with reference to what method should be employed for securing subsequent drainage.

In addition, Dr. Storer believed that there were many instances in which the question of ovotomy was distinctly presented:

First. After supposed death of the mother, and with the hope of removing and saving the child.

Second. In cases of rupture of the uterus; and

Third. In cases of extra-uterine pregnancy.

Dr. Jenks, of Detroit, did not disapprove of the operation of laparo-elytrotomy, or abdomino-vaginal ovotomy, but he thought we were not yet in a position to adopt it as a substitute for Cæsarean section. Perhaps in the hands of expert operators the operation could be resorted to with advantage, but for the ordinary operator he regarded it as a much less available operation.

Dr. Albert H. Smith, of Philadelphia, remarked that he felt compelled to endorse the view taken by Dr. Parvin with reference to the operation under consideration. He was of the opinion that Dr. Thomas had not established any immunity from peritonitis by his operation. There was no guaranty that the operation could be performed without involving the peritoneum except in the hands of experts like Dr. Thomas. In quite a number of the cases which had been operated upon the bladder was lacerated. The amount of outrage committed upon the os uteri and the tissues surrounding it was very great, and exposed the woman to disastrous results. We were obliged to operate and draw a child through an undilated os, and to do that with the haste which had seemed necessary, laceration was liable to occur, and the peritoneum to become involved. He was not able to grant that Dr. Thomas had given any good reason why the operation of laparo-elytrotomy should take the place of the Cæsarean section, which, if performed earlier, might be successful in a vast majority of cases.

On motion made by Dr. James P. White, of Buffalo, the paper was referred to the Committee on Publication.

The Section then adjourned, to meet on Wednesday at 3 P.M.

Wednesday, June 5th—Second Day.

The Section was called to order at 3 P.M. by the Chairman.

HOUR-GLASS CONTRACTION OF THE UTERUS PRIOR TO EXPULSION OF CHILD.

Dr. Thad. A. Reamy, of Ohio, read a paper upon the above subject, and related the history of a case which occurred in the practice of Dr. J. B. Edwards, of Xenia, Ohio.

The points of interest in the case related were:

1. The perfect coaptation of the abdominal wall to the external shape of the uterus.

2. The extraordinary fact that the direction of the contraction in one case was not circular, but oblique.

3. The singular fact that regular contraction and relaxation occurred above the point of constriction, with complete paralysis below that point.

4. The marvellous power exerted by the muscular fibres causing constriction.

5. The influence in one case of prolonged anæsthesia in overcoming spasm, which was, at first, but little affected thereby.

This complication of labor was regarded as rare, and the causes of the irregular contraction were regarded as conjectural.

Dr. H. O. Marcy, of Cambridge, Mass., referred to cases reported by Alfred Hosmer in the *Boston Medical and Surgical Journal*, in which a condition similar to that alluded to by Dr. Reamy had been found in the cervix.

Reference was farther made to Wm. Hunter's plates, showing the physiological condition of the cervix at full term; the cervix was much larger than was generally described, or by us estimated. Perhaps it was at the cervix that those contractions existed, the cervix being one-fourth or one-sixth the entire organ.

Dr. Miller, of Chicago, referred to a case in which irregular contraction of the uterus was produced by the fœtus on account of a diminished quantity of liquor amnii. That explanation, however, might not be applicable to the cases reported by Dr. Reamy.

Dr. Dunster regarded cases of irregular contraction of the uterus as among our physiological puzzles.

Dr. W. W. Porter, of the University of Syracuse, N. Y., referred to a case in which relaxation of such contraction was effected by an emetic.

Dr. Storer regarded the suggestion made by Dr. Porter as a valuable one.

Dr. Trenholme, of Montreal, speculated with reference to the causation of irregular contraction of the uterus.

Dr. Parvin referred to the question of treatment when such irregular contractions were present. The treatment adopted by Dr. Edwards, in the case reported by Dr. Reamy, had been to force the hand through the constriction, and within an hour the woman died, and was said to have died of shock. Was not death hastened by persistent effort to overcome the resistance by manual interference? Would it not have been better practice to have waited a little for relaxation, inasmuch as there was no special reason why the placenta should be immediately removed?

Dr. Baker, of Whitesboro, suggested the use of atropia instead of emetics to produce relaxation of rigid os.

Dr. Bontecue, of Troy, favored the use of atropia in that class of cases.

Dr. Reamy remarked that the constriction in his case was not at the os internum; it did not correspond to the circular fibres of the os internum. He regarded all the explanations concerning the condition in this class of cases as unsatisfactory. He doubted extremely the propriety of Dr. Edwards's treatment so far as manual interference was concerned, and also the use of one-quarter-grain doses of morphine; his object, however, had been not to speak of treatment or causation, but to direct attention to features specially interesting in the condition found.

SUB-COMMITTEE TO WHICH PAPERS WERE REFERRED.

On motion, a committee of five was formed, to which all papers presented to the Section should be referred. The committee consisted of the Chairman, the Secretary, and Drs. E. S. Dunster, of Mich., De L. Miller, of Ill., and Albert H. Smith, of Pa.

Dr. Horatio R. Storer, of Rhode Island, then read a paper on

THE FREQUENTLY GYNECOLOGICAL ORIGIN OF INHERITED FORMS OF STRUMOUS DISEASE, AND THE CONSEQUENT INDICATIONS FOR TREATMENT.

"The prevention of disease," said Dr. Storer, "is more important than its cure," and he then proceeded to discuss the relation which struma and syphilis had to each other. Much could be done in removing syphilis by the firm tread of the law, but there were *five* points with reference to the main question which were within our province:

1. Syphilis, like other toxæmia, was more prone to become constitutional in the strumous than in the perfectly healthy subject.

2. Struma, the result of syphilis, was comparatively seldom recognized during life, and still more infrequently received appropriate treatment.

3. Syphilitic struma, personal or by heredity, was in no sense self-limited.

4. Predisposition to syphilis by heredity, both of itself and as affected by struma, was much more frequently intense than generally supposed.

5. Transference of primary syphilis, sometimes by perfectly healthy women who were entirely free from specific disease, was an element not to be overlooked in discussing syphilitic struma.

Dr. Storer believed that a sufficient number of perfectly healthy women could transfer the contagion to keep up the disease indefinitely. He also maintained that consumption was caused by syphilis; that the contagiousness of phthisis was established; that syphilis was never entirely eradicated from the individual; and that it was possible to diagnosticate between syphilis and struma by means of the microscope.

The *five* propositions being admitted, it followed:

1. That the more completely we prevented [by wise sanitation], controlled [by intelligent supervision], and perhaps, cured [in certain cases by specific treatment] phthisis and other forms of strumous disease, to such an extent did we limit the probable infection, propagation, and intensity of syphilis.

2. Similarly, that the more actively we endeavored, by public and private measures other than those now indicated, to absolutely eradicate syphilis from any community, to such an extent did we limit the occurrence, personally and by inheritance, of the various forms of strumous disease; and that

3. *A fortiori*, and even to a greater extent than had as yet been or could be effected by governmental or private attempts to control venereal, by examining for, or by treating its primary lesions by themselves, and thus remove from our midst a large moiety of the material upon which the disease has thus far subsisted, we might hope eventually to get its upper hand. It would be an added triumph for gynæcology, for the most real practical steps towards that great end would prove, upon the large and effectual scale, to have initiated from ourselves.

The paper was referred to the Sub-Committee.

NEW CLAMP FOR PERINEORRHAPHY.

Dr. W. W. Munson, of Otisco, N. Y., exhibited a new clamp as a substitute for Baker Brown's quills. It consisted of an ordinary hard rubber quill, with buttons attached to prevent it from rolling. The wire passed through, and was fastened around the button. The advantages claimed for it were:

1. Ease of application;

2. Only one wire passed through the tissue; and,

3. The wire could be loosened or tightened without cutting.

The instrument received favorable mention from Dr. Albert H. Smith, of Philadelphia, and Dr. E. S. Dunster, of Mich.

NEW METHOD OF DENUDING TISSUES IN THE RESTORATIVE SURGERY OF THE FEMALE PELVIS.

DR. ALBERT H. SMITH, of Philadelphia, described a new method of denuding tissues, which was regarded as especially valuable when it was desirable to secure fresh tissue without much loss of substance. For that purpose he recommended the use of a burr, considerably larger than the dental burr, which could be brought in contact with the surface while in rapid rotation by means of a dental engine. It was especially applicable in Emmet's operation, after the surface to be denuded had been marked out with a sharp-pointed bistoury.

DR. WM. B. ATKINSON, of Philadelphia, exhibited a

NEW CEPHALOTRIBE,

devised by Dr. Wallace, of Philadelphia, after which the Section adjourned, to meet on Thursday at 3 P.M.

THURSDAY, JUNE 6TH—THIRD DAY.

The Section was called to order at 3 P.M. by the Chairman.

On motion, the Chairman's address was referred to the Committee on Publication.

CONNECTION OF THE HEPATIC FUNCTIONS WITH UTERINE HYPERÆMIAS, FLUXIONS, CONGESTIONS, AND INFLAMMATIONS.

DR. LEVI F. WARNER, of Boston, presented a paper upon the above subject, which was a substantial plea in favor of constitutional treatment for pelvic disease occurring in the female.

Dr. Warner believed that much harm had been done by the argument that, because we knew but little about the action of medicines, we should be very sparing in their use; and also by the doctrine of self-limitation of disease. Disease, instead of being self-limited, might in many cases be limited by a judicious course of treatment. The presumption of self-limitation of disease in a physiological sense was a misnomer. Dr. Warner believed that there was an intimate connection between uterine and hepatic disease, and *vice versa*. His conclusion was, that the successful treatment of uterine hyperæmias, congestions, fluxions, and inflammations depended as often upon measures which were constitutional as upon those which were strictly local, and that sometimes without such constitutional measures cure was impossible.

DR. STORER regarded the paper as a step in the right direction. For, while he considered the pelvic organs second to none in economy, he did not regard the uterus and the ovaries as the only organs in the economy; and he believed that the practitioner who treated the uterus and ovaries, forgetting the liver, the brain, the stomach, the spleen, and other organs, was acting unscientifically, unprofessionally, and, in many cases, unsuccessfully.

DR. BARTLETT, of Wisconsin, remarked that the older he grew the more he found it necessary to attend to general conditions, and the less reliance he placed upon purely local treatment in the entire class of pelvic affections. He spoke approvingly of the paper.

DR. MARCY thought that the danger of to-day was that young men were graduated into specialties which they went out to practise, thinking that they knew more than any one else. The character of *all* the symptoms should be carefully noted before prescribing for any individual case.

The paper was referred to the Sub-Committee.

INDICATING UTERINE SOUND.

DR. MARCY exhibited an indicating uterine sound which had been devised by Charles R. Jennison, of the firm of Codman & Shurtleff, Boston. It was so constructed that pressure upon one end caused the other end to curve in the opposite direction.

THE SURGICAL TREATMENT OF UTERINE FIBROIDS.

DR. JOHN C. IRISH, of Lowell, Mass., presented a paper upon the above subject, in which he recommended removal of the uterus in the treatment of fibroids whenever they would certainly eventuate in the death of the patient at no distant period. Under such circumstances it was most emphatically our duty to give the woman the last remaining chance for life that the operation offered. It could not have so extended a range of usefulness, nor would it furnish so brilliant results as ovariotomy, yet he believed that it would render good service in the saving of human life.

The paper was discussed by Drs. A. H. Smith, of Philadelphia, and E. S. Dunster, of Ann Arbor.

UTERINE FIBROIDS TREATED BY ELECTROLYSIS.

DR. EPHRAIM CUTTER, of Boston, Mass., gave a brief *résumé* of the treatment of fifty-eight cases of uterine fibroids by electrolysis, as practised by Dr. Gilman Kimball, of Lowell, Mass., and himself.

Reference was first made to those cases in which electrolysis was applied without anæsthesia.

The difficulty which was first experienced in introducing the needle into the dense fibroid without having it twist in the hand of the operator was referred to, and such difficulty had led to the use of a needle having very much the shape of a surgeon's grooved director.

The results obtained in a little over fifty cases, as given from memory, were as follows: There were four deaths. There were seven cases in which no relief had been obtained.

In three cases relief from symptoms had been obtained, but the size of the tumor remained unchanged.

Four cases were entirely cured.

In thirty-two cases the tumors had been diminished in size, and relief of symptoms had followed the operation. In these cases the operation was simply undertaken to arrest the growth of the tumor. In the great majority of them the growth was arrested, and the average reduction in the size of the tumor was one-third in cases in which any diminution in size occurred. The peritoneal inflammation which had followed the operation had been very slight, and of brief duration.

In one case abscess was formed. The puncture was about one and a half inches deep, and the abscess was about four inches deep. In one case fistulous openings were created by the improper protection of the needle where it passed through the skin.

They continued to use the same kind of battery as at first, namely, one with large plates. It was their impression that what was needed for the operation was quantity and not intensity of the electrical current.

It was their opinion also that it was not advisable to prolong the operation over fifteen minutes; from

five to ten minutes was an average length of time. In no case should the operation be performed at the office of the physician. The first operation should not be continued longer than three minutes.

In a majority of the cases the needle was introduced into the tumor through the abdominal wall, but there was no rule with reference to that point. In one case both electrodes were introduced through the rectum. Of the two outlets, they preferred the rectum to the vagina.

The manner of introducing the needle was regarded as important; it should be introduced with a single thrust. The manner of its withdrawal was also important; firm compression of the tissues surrounding the needle should be made, in order to prevent separation of the various layers, and then the needle withdrawn quickly. Since they had used anæsthetics no alarming symptoms had been developed in the way of shock, etc., and Dr. Cutter believed it to be unwise to attempt to perform the operation without the aid of an anæsthetic.

Dr George M. Beard, of New York, remarked that he began to experiment with reference to the electrolytic treatment of fibroids of the uterus in 1870, and used a long, spear-shaped electrode, something like that described by Dr. Cutter. He then used only one pole, the negative, and through the vagina. Afterwards, he carried on the same line of investigation with reference to other tumors, and had noticed with reference to electrolytic treatment of fibrous tumors about the neck, that some of them went down rapidly under treatment, and never returned, while others were reduced perhaps twenty-five per cent. in size, and then remained permanent. He agreed with Dr. Cutter with reference to the use of a mild current, and the time to be occupied at each application.

Safety was an important element in the operation, and to that end Dr. Beard recommended that the negative pole should be first used, and perhaps afterwards both poles might be employed. In some cases good results could be obtained by the use of the negative pole alone. He had sometimes used the faradic current without the needle. The accessory symptoms connected with uterine fibroids, such as excessive hemorrhage, anæsthesia, neuralgia, and the various effects upon the general nervous system, were almost always greatly and quickly relieved by either method.

With regard to the battery, he thought it made no difference what kind was used, provided we had any of those now manufactured. The battery with large plates, such as used by Dr. Cutter, gave no more electricity than one with smaller plates, as could be mathematically demonstrated by Ohm's law. The important point was to begin with small currents.

He believed introduction of the needle into any part of the abdomen could be done without any injury whatever.

Dr. Mussey, of Ohio, referred to cases in which he had afforded relief from the symptoms attending uterine fibroids by the use of the electric current applied externally. It was his opinion that most of the thirty-two cases mentioned by Dr. Cutter would have done as well by the use of the electric current applied externally as by the use of the needles.

Dr. J. J. Caldwell, of Baltimore, believed that uterine fibroids could be benefited by the external application of electricity. He preferred galvanism to the faradic current.

BATTEY'S OPERATION FOR EXTIRPATION OF THE OVARIES.

A paper upon the above subject was presented by Dr. George J. Engelmann, of St. Louis, Mo.

In it were considered the dangers and the difficulties of the operation, and, although one of its advocates, yet Dr. Engelmann believed its dangers were greater than had been supposed. In average cases the dangers were greater than in ovariotomy; and its dangers were greater than Battey's own cases would lead us to conclude. It was more dangerous than ovariotomy because: 1. It was a more delicate and difficult operation; 2. Because the pedicle could not be fastened in the abdominal incision except in a few exceptional cases; and 3. The pedicle in the abdominal cavity was in a most favorable condition to respond to irritation.

After a few remarks by Dr. Trenholme, of Montreal, the paper was referred to the Sub-Committee.

On motion by Dr. Smith, of Philadelphia, the thanks of the Section were tendered to Dr. Jenks, Chairman, for his able address.

Thanks were returned to the Secretary, and the Section adjourned.

SECTION ON SURGERY AND ANATOMY.

Dr. Henry H. Smith, of Philadelphia, Chairman.
Dr. E. T. Easley, of Little Rock, Ark., Secretary.

Tuesday, June 4th—First Day.

The Section was called to order at 3 P. M. by the Chairman.

A sub-committee of five, consisting of Dr. A. C. Post, of New York City, Dr. Watson, of Jersey City, Dr. F. Hyde, of Cortland, N. Y., and the Chairman and Secretary of the Section was appointed, to which all the papers read before the Section should be referred.

Dr. Lucien Howe, of Buffalo, presented a patient upon whom plastic operations had been performed for the formation of a new eyelid.

EXCISION OF THE DIAPHYSIS OF THE TIBIA.

Dr. C. C. F. Gay, of Buffalo, read a paper upon the above subject, and it received the usual reference.

SEPTICÆMIA FOLLOWING RESECTION OF BONES

was the title of a paper read by Dr. S. H. Weeks, of Portland, Me.

The paper was discussed by Drs. Keller, Woodward, Waterhouse, and Weeks, and referred to the Sub-Committee.

TRACHEOTOMY WITHOUT TUBES.

Dr. Henry A. Martin, of Boston, read a paper upon the above subject, in which he claimed that it was the office of the physician not only to attempt to restore to health but to mitigate pain, and to mitigate pain not only when such mitigation might conduce to recovery, but when it might serve to assuage the pains and agonies of death. He was an advocate of tracheotomy in croup. His method of performing the operation was to make the ordinary incision into the trachea, introduce silver wires into the edges of the wound and secure them behind by means of an elastic band. By keeping the opening patent in that manner the danger from obstruction of the tubes was avoided, and the patient could be left in the care of the nurse with comparative safety. Dr. Martin first performed the operation in that manner thirty-five years ago.

The paper was referred without discussion.

NEW METHOD OF CUTTING BANDAGES.

Dr. Martin exhibited roller bandages which had

been cut in an ordinary turning lathe. They were made from cross-barred wiggin in the following manner: A piece of the material, of any desired length, was tightly wound upon a stick like a window-curtain roller, then put into a turning lathe and cut into bandages of any width by means of the workman's pointed chisel.

IDENTITY OF HOSPITAL GANGRENE WITH DIPHTHERIA

was the title of a paper read by DR. JOHN D. CARPENTER, of Pottsville, Penn.

Dr. Carpenter's conclusions were based on observations made in 100 cases of hospital gangrene occurring in an army hospital at Cincinnati in 1361, and subsequent observations. He was persuaded that the disease depended upon a specific cause, diphtheria, which by attacking a wounded surface produced a condition known as hospital gangrene, which could be communicated to persons in private life as well as to those congregated in hospitals. His conclusions were as follows:

Hospital gangrene and diphtheria were identical in the following particulars,

1. In their causation—by an atmospheric contagion, becoming epidemic under suitable circumstances.
2. In the interchangeableness of their miasm—either disease was capable of propagating the other.
3. In their pathological features—exudations, ulcerations, mortifications, hemorrhage, erysipelas and general blood-poisoning.
4. In the double form of each disease—simple, catarrhal or pulpy and malignant ulceration or phagedenic.
5. In the local infection as being preliminary to the general disease.
6. In the parallel methods of cure, and in the identical remedies used with success in both diseases.
7. In the similar modes of death, and particularly the comparative frequency of heart-clot in both diseases.

In absence of Dr. D. M. Clay, of Shreveport, La., his paper on

PERITYPHLITIC ABSCESS

was read by title, and referred to the Sub-Committee.

SUPPLEMENTARY REPORT ON POTT'S DISEASE.

DR. LEWIS A. SAYRE, of New York, made a supplementary report on Pott's disease. He declined to submit it to the committee, as he wished to present it in a more complete form at the next meeting of the Association. One object in view, in calling the attention of the Section to the subject, was to secure the aid of the members in collecting cases which had been under treatment by means of the plaster-of-Paris jacket; what their condition was when treatment was commenced; how long treatment was continued; the results obtained; and, if cured, how long the treatment had been discontinued. Dr. Sayre gave the following synopsis of his supplementary report:

It embraced the complete history of 125 cases of spondylitis. More than double that number had been treated; but their histories were yet incomplete, and, therefore, they were not embraced in the report.

The ages of the cases reported varied from 4 to 53 years.

The condition of the spine varied from the slightest curvature, of few months' standing, to the most aggravated deformity, complicated with abscesses and paralysis.

All the cases had been treated by suspension and the plaster-of-Paris jacket.

Many of them had been treated by the use of various braces from two to fourteen years, and in each instance the disease was progressive when treatment by suspension and the plaster bandage was commenced. In every case relief was given by suspension, and in many the relief from pain was complete. In several cases, the paralysis was so far relieved that they were able to move their limbs as soon as the plaster dressing had "set." In some instances the patients were able to walk within twenty-four hours. Special mention was made of the following case: A male, æt. 53. had suffered from spondylitis of dorsal vertebræ since 11 years old. He had worn braces of various kinds continuously for over twenty years. He had had complete paralysis of both lower extremities for three years and eight months, and had suffered such pain as required the continued use of hypodermic injections of morphine and opium suppositories. He was *immediately* relieved of all pain the moment he was suspended. He was able to move his legs with ease forty-eight hours after the application of the plaster jacket. At the end of five days he was able to walk. His improvement had continued, and he was able to attend to his regular business as an artist. The first jacket was worn three months. The second was worn three weeks, when it was cut down, properly bound with leather, supplied with straps and buckles, and then worn as a corset. His health was excellent.

Among all the cases treated, only two deaths had occurred. One patient, 33 years of age, died of aneurism of the aorta. Another, a boy 11 years old, was thrown from the upper berth of a sleeping-car, and died within a few hours. No post-mortem of the last case could be obtained.

PLASTIC SURGERY

was the title of a paper read by DR. A. C. POST, of New York. Two cases of blepharoplasty were reported, with remarks. One was a case in which the lower eyelid had been removed for epithelioma. The other was a case of ectropion of both eyelids. Both were severe cases. In the first case the operation was very successful. In the second case the eversion was overcome by a series of operations, so that in the course of one year slight inversion was produced. In the progress of the second case it was demonstrated that wounds of recently transplanted tissue underwent more rapid, more perfect healing, and with less scar than wounds of the skin in its normal relation.

SENSIBILITY OF THE TRANSPLANTED FLAPS.

The sensibility of the two flaps in the second operation differed in this respect: in the flap removed from the temporal region the sensibility was referred to the part from which the flap was taken; while in the flap taken from the cheek the sensibility was referred to the position occupied by the flap after its transplantation.

FORMATION OF EYEBROWS.

New eyebrows were formed from the cutaneous flaps taken from the temples. That fact was regarded, as almost unique. Dr. Pancoast, of Philadelphia, had in one case had the same result, but it had not been reported.

PREVENTION OF SEPTICÆMIA IN SURGERY—NEW PRINCIPLE IN THE USE OF DRAINAGE TUBES — PROPHYLAXIS BY MEANS OF CARBONIC ACID GAS.

DR. E. M. MOORE, of Rochester, read an interesting paper upon the above subject, of which the following is an abstract:

Dr. Moore opened his remarks by calling attention to the effect of outflow of blood in the act of dressing a wound, being a preventive of septicæmia, by excluding the contact of air, and when the deep parts were compressed the union by adhesion was rendered more likely. That comported with surgical experience. But when suppuration was inevitable, the drainage-tube should be used *at once* before exudates had occurred, and those should be removed as fast as thrown out. The principle was illustrated by a case of gunshot wound of the knee, which was penetrated at the upper part by a charge of shot and slugs, crushing the patella, and opening the joint freely. The joint was cut open for three inches, and a counter-opening made, through which a drainage-tube of rubber, with holes in the sides, was drawn. That was connected with a fountain-syringe, which was filled with water at 105° Fahrenheit every half hour. That was continued for a week. Afterwards the water was not used as often. The knee was enveloped in cotton, surrounded by sheet-rubber. That was kept wet with water at the same temperature. The patient, a youth of seventeen, made a good recovery with anchylosis. The pulse never rose above 110, and continued at that point for a few days only. At no time did any alarming symptoms appear. The plan of putting in a drainage-tube *before inflammatory symptoms appeared*, and thus removing the secretion at once, was thought to be uncommon practice, though that of using them *after* suppuration was common enough.

CARBONIC ACID GAS AS A PROPHYLACTIC OF SEPTICÆMIA.

But the plan that was claimed to be new, was a proposed prophylaxis by exclusion of air during an operation, by occupying the space with carbonic acid gas. This was poured from the large mouth of a funnel over the abdomen, before the cut was made in the linea alba, in a case of ovariotomy, and continued without a moment's pause to the end of the dressing. The gas was contained in a rubber-bag, and passed through water at the temperature of 105° Fahrenheit. No toxic effect of any kind followed. The patient recovered without the development of any severe symptoms, and very rapidly.

The paper was referred to the Sub-Committee.

The Section then adjourned, to meet on Wednesday at 3 P.M.

WEDNESDAY, JUNE 5TH—SECOND DAY.

The Section was called to order at 3 P.M. by the Chairman.

DR. MOSES GUNN, of Chicago, occupied the chair while the Chairman, DR. HENRY H. SMITH, of Philadelphia, gave

DEMONSTRATIONS FROM PREPARATIONS OF CERTAIN POINTS IN THE PATHOLOGY OF BONES, ESPECIALLY TUBERCLE.

Specimens from the elephant, the ox, and the human femur were exhibited, showing the cancellated structure of bone, and also specimens of intervertebral cartilage.

A specimen was exhibited to demonstrate that the round ligament at the hip-joint arose directly from the bone itself.

The demonstrations were to prove that tubercle was deposited in the cancellated structure of bone, and was the foundation for diseases of the joints.

Discussion followed, and was participated in by DRS. J. W. S. Gouley and Lewis A. Sayre, of New York.

DR. GOULEY believed that tubercle could not be deposited in the cancellated structure of bone, for the reason that two bodies could not occupy the same place at the same time. The bone-cells must be changed or destroyed thereby, making place for tubercle, if it was present; it was not a deposit.

DR. SAYRE referred to a case of hip-joint disease, which he saw in consultation with Sir James Paget and Wm. Adams, of London. The patient was a child, who had received an injury to the hip by a fall two years previous to the consultation. Hip-joint disease was diagnosticated by Paget, Adams, and Sayre. He was the last male descendant from an ancient family in Ireland, whose genealogy had been traced back for *eight* generations. One branch of the family had twenty-two members who lived to the average age of ninety years. Out of the entire family only seven persons had died of any scrofulous disease, and those cases could be traced directly to intermarriage with families in which scrofula existed. The case was regarded as unmistakable evidence that joint disease could be produced by external violence, independent of constitutional disease.

Dr. Smith resumed the chair.

EXTIRPATION OF THE THYROID GLAND WITH SPECIMENS.

DR. JULIUS F. MINER, of Buffalo, read a paper upon the above subject, in which he first alluded to the general condemnation of operative procedure for the removal of the gland in cases of goitre.

The operation, however, had been successfully performed, and to the successful cases already reported Dr. Miner added THREE, the histories of which he gave, and exhibited the specimens to the Section.

DR. SAYRE, of New York, mentioned a case in which the thyroid gland was successfully removed, and the woman made a good recovery.

DISEASE GERMS, THEIR ORIGIN, NATURE, AND RELATION TO WOUNDS.

DR. B. A. WATSON, of Jersey City. N. J., read a lengthy paper upon the above subject, and reached the following conclusions:

First. That there were certain germs in the air, more particularly in the atmosphere of overcrowded hospitals, which, if permitted to enter wounds, gave rise directly to living organisms, and to inflammation and suppuration; and indirectly to all septic conditions which were found as wound complications.

Second. That the successful management of wounds depended principally on the ability of the surgeon to keep the wounds under all circumstances and at all times free from germs and living organisms; and, therefore, the value of any method of wound treatment depended primarily on the degree of antisepsis which could be obtained by it.

Third. That the occasional discovery of a few bacteria in a wound which had been treated antiseptically, did not disprove the fact that those bacteria arose from germs; but might be satisfactorily explained in a variety of ways, especially by the existence of germs which had not been destroyed by the means employed.

On motion, all papers read by members of the Sub-Committee were referred to a Special Committee consisting of Dr. Hodges, of St. Louis, and Dr. Hutchinson, of Brooklyn.

Dr. Watson's paper was referred to the Special Committee.

DR. FREDERICK HYDE, of Cortland, N. Y., read a paper on

THE PROCESS OF REPAIR IN WOUNDS WITH AND WITHOUT ANTISEPTIC TREATMENT.

Dr. Hyde did not reject the antiseptic plan of treatment, but believed that the success of any plan of treatment of wounds depended very much upon the condition of the patient. If in good condition a much richer quality of healing material was afforded than when the constitution was in a depraved condition. With reference to the plan of treatment to be adopted, Dr. Hyde believed that it should first aim to protect the purity of the primary exudation, that it might become as soon as possible fibro-cellular tissue, and maintain its just relations to the sundered, injured textures, that its advancing development might not be hindered, but on the contrary, made as summary as possible.

The paper was referred to the Special Committee.

CONSERVATIVE SURGERY IN COMPOUND FRACTURES.

Dr. Robert Burns, of Frankford, Philadelphia, read the history of a case of double compound comminuted fracture of the humerus, and compound fracture of the radius and ulna in four places. The limb was saved by conservative treatment, which consisted in placing it in a rough-shaped wire splint in a bed of soft oakum, and meeting indications as they arose. It was kept wet with a lotion consisting of acetic acid, whiskey, carbolic acid, and water.

The paper was referred to the Sub-Committee.

COMMUNICATION FROM DR. BATTEY, OF ROME, GA.

The Secretary read a communication from Dr. Battey, announcing his inability to be present at the meeting of the Association. His paper on

PERMEABILITY OF THE ENTIRE ALIMENTARY CANAL BY ENEMATA

was read by title and referred to the Sub-Committee.

CARCINOMA OF THE CONJUNCTIVA.

Dr. A. N. Blodgett, of Boston, read a paper giving the history of a case of carcinoma affecting the conjunctiva, with remarks concerning the pathology of the disease.

The paper was referred to the Sub-Committee.

THE EXCISION OF PHALANGES OF THE FINGERS AND TOES.

Dr. A. C. Post, of New York, read a paper upon the above subject, and demonstrated the propriety of resorting to excision instead of amputation in certain cases of angular deformity of the fingers and toes. The paper was referred to the Special Committee.

The Section then adjourned to meet Thursday, at 8 P.M.

THURSDAY, JUNE 6TH—THIRD DAY.

The Section was called to order by the Secretary at 8 P.M., and, in absence of Dr. Smith, Dr. Hodgen, of St. Louis, was elected Chairman.

The first paper was read by Dr. Frank H. Hamilton, of New York, on

EXSECTION OF THE METATARSO-PHALANGEAL ARTICULATION IN VALGUS OF THE GREAT TOE.

On motion, the regular order of business was suspended, and Dr. Lewis A. Sayre, of New York, exhibited a child that had been treated and cured of Pott's disease by the use of the plaster-of Paris jacket. The child had taken no medicine, and the deformity remaining was not very marked.

SHORTENING IN FRACTURES.

Dr. Moses Gunn, of Chicago, offered the following preamble and resolution:

"*Whereas*, This Section having expressed an opinion upon the results of fractures of long bones; and

"*Whereas*, In general convention a member has asked and been accorded the privilege of recording his protesting vote; therefore

"*Resolved*, That this Section reaffirms its opinion that shortening in cases of fractures of the long bones is the rule in practice, regardless of any of the means of treatment now in use."

The resolution was warmly discussed, but almost unanimously adopted, Dr. Lewis A. Sayre, of New York, dissenting from the opinion expressed in the resolution, and requesting that his protest against its passage be placed on record.

The regular order of business was then resumed, and Dr. John H. Packard, of Philadelphia, read a paper on

FRACTURES NEAR THE WRIST-JOINT.

The paper was discussed at considerable length by Dr. E. M. Moore, of Rochester; after which Dr. Theodore A. McGraw, of Detroit, Mich., read a paper on

THE PATHOLOGY, DIAGNOSIS, AND TREATMENT OF CANCER.

The paper was referred to the Sub-Committee.

A NEW USE OF CARBOLIZED LIGATURES

was the title of a paper read by Dr. Henry O. Marcy, of Cambridge, Mass.

The new use to which Dr. Marcy had put the carbolized catgut ligature was for the radical cure of hernia. The plan was to cut down upon the hernia, and then close the ring with the carbolized catgut ligature. He believed that the ligatures disappeared, and were converted into new connective tissue.

The paper was referred to the Sub-Committee.

DETECTION OF MINUTE CALCULI BY AUSCULTATION WITH A NEW INSTRUMENT,

By Dr. Edward Andrews, of Chicago.

Paper read by title and referred.

CONCERNING THE NATURE OF GONORRHŒA.

By T. Clary Maddox, of Baltimore, Md. Explanation of those cases in which gonorrhœa had been succeeded by secondary syphilis, although the individual had never been infected by primary chancre.

Read by title and referred.

DISCUSSION ON FRACTURES NEAR THE WRIST-JOINT.

Dr. Moore, of Rochester, resumed the discussion of Dr. Packard's paper on fractures near the wrist-joint. He described his method of reduction and plan of treatment, and said that in 150 cases he had had no deformity or shortening.

Dr. F. H. Hamilton, of New York, followed in the discussion, and gave his experience in the study and treatment of fracture of the radius near the wrist-joint. He had been able to treat them without shortening.

Dr. Sayre, of New York, asked Dr. Hodgen if he regarded the radius as one of the long bones?

Dr. Hodgen replied in the affirmative.

Dr Sayre then suggested that Dr. Gunn should modify his resolution with reference to shortening in

fractures of the long bones so that it would read fracture of the *shaft* of long bones, otherwise the Section would stultify itself by the action it had taken upon the question.

Dr. Gunn remarked that the suggestion involved only the difference between tweedle-dum and tweedle-dee.

Dr. Hodgen asked Dr. Moore if he had treated any of his cases of fracture of the radius at its lower extremity without subsequently leaving an abnormal prominence of the styloid process?

Dr. Moore replied that formerly he saw such prominence, but that since he had learned how to reduce and treat the fracture properly he had not seen such deformity.

The Section then adjourned.

MASSACHUSETTS MEDICAL SOCIETY.

Annual Meeting held in Boston, June 11th and 12th.

(Special report for The Medical Record.)

First Day—Tuesday, June 11th.

The annual meeting of the Massachusetts Medical Society was held in the Lowell Institute hall, Boston, on Tuesday and Wednesday, June 11th and 12th.

The President, Dr. William Cogswell, called the meeting to order at noon on Tuesday, and the reading of papers was begun.

ANOMALIES IN PREGNANCY.

The first paper, on Anomalies in Pregnancy, was read by John Crowell, M.D., of Haverhill. Of such anomalies, he considered those of severe or uncontrollable vomiting and ptyalism, unconscious pregnancy, and mistaken diagnosis in pregnancy. All these exceptional phenomena were illustrated by cases which had come under the observation of the reader. In the case of uncontrollable vomiting the only remedy which afforded relief was the subcutaneous injection of morphia, which was given every three or four hours in doses of from one-eighth to one-sixth of a grain. Although the drug was used during nearly the entire period of gestation, and was dropped immediately after parturition, the patient experienced none of the distressing results which often follow the protracted use of opiates, and she was delivered at full time, after a natural labor, of a healthy child.

FLOATING SPLEENS.

F. C. Shattuck, M.D., of Boston, read the next paper, which was entitled Floating Spleens. The paper was based on a case which had come under the care of the writer. The literature of the subject shows fifty-one cases. The first recorded case was in 1581. The two chief factors in the causation of dislocation of the spleen are mechanical elongation of the ligaments by the traction of an enlarged organ, and undue congenital laxity or delicacy of the ligaments. Only eight out of the fifty-one cases occurred in males. The possible influence of pregnancy is suggested by the fact that the lesion occurs most frequently in females. Rupture of the gastro-splenic ligament is a fortunate thing for the patient, the traction on the fundus of the stomach having been known to result in gangrene of the gastric wall, and death. The diagnosis, prognosis, and treatment of the lesion were referred to. The question of treatment was considered from four points of view: according as it might seem desirable to do nothing; to attempt permanent reduction of the dislocated organ; to aim at alleviation or possible cure by reducing the size; or to excise the organ.

ABSENCE OF RESONANCE IN FIFTH RIGHT INTERCOSTAL SPACE DIAGNOSTIC OF PERICARDIAL EFFUSION

was the subject of a paper by Thomas M. Rotch, M.D., of Boston.

The paper was fully illustrated by diagrams and casts. The rules ordinarily given for the determination of pericardial effusion were stated by the writer to be somewhat erroneous. The diagnosis of the effusion is sometimes difficult; tapping has been resorted to and the heart punctured. The results obtained by the writer, from experiments made on the human cadaver, showed that any area of flatness on the left of the sternum may be that of an enlarged heart, but that extending two, three, or more centimetres beyond the sternum in the fifth right intercostal space was due to pericardial effusion. In such effusion this would be the point of election for the introduction of the trocar.

The Medico-Legal Branch.

The afternoon session was devoted to the reading of papers by the members of the Massachusetts Medico-Legal Society, a Society whose regular members are such Fellows of the Massachusetts Medical Society as have been appointed medical examiners.

Dr. A. Hosmer, President of the Medico-Legal Society, delivered an address. In it he stated the objects of the Society, as defined by its constitution, to be, to elevate the official character of the medical examiner, and to assist him in the discharge of his duties; to collect and utilize such facts as have a medico-legal value; to excite a general interest in the subject of forensic medicine, and to promote its successful cultivation. The duties of the present medico-legal examiner, as compared with those of the old coroner, were clearly set forth.

Dr. F. Winsor, the Secretary of the Society, stated that during the year there had been made by members of the Society 448 views and 116 autopsies; 21 prosecutions, and five convictions had resulted. It was suggested, in view of the frequency of deaths from drowning, that the State should furnish instruction in swimming and in the resuscitation of the drowned. Of fatal railroad accidents, one-half are due to the walking of persons, many of them intoxicated, on the track.

THE THEORY AND PRACTICE OF INQUESTS.

Theodore H. Tyndale, Esq., read a paper concerning Coroners, and the Theory and Practice of Inquests. He stated that under the old law the coroner's work was useless because it had to be done over again by other officers. The coroner was both examiner and judge. Under the new law the duties of the medical examiner are clearly defined. He is only to determine whether violence has been committed. Who committed it, if another, and under what circumstances, are not to be sought after by the examiner, but by the judge.

Dr. R. H. Fitz presented a paper on the Value of Anatomical Evidence. Such evidence is physical. The group of lesions which will be found in a case of probable suffocation were accurately described.

Dr. E. S. Wood, in a paper on the Relation which Chemistry bears to Forensic Medicine, gave practical directions as to how organs and their contents should be preserved by the examiner, in cases of death from suspected poisoning, and sent to the chemist.

Dr. F. W. Draper reported cases illustrating the

work and duties of the medical examiner. These cases illustrated the importance of the duty of the medical examiner in determining the question whether violence had been committed. In all of them foul play had been suspected, but the autopsies showed that death had resulted from natural causes.

A case of Arsenical Poisoning, with fatty degeneration of the liver, kidneys, etc., was read by DR. J. G. PINKHAM. The reader emphasized the fact that in cases of poisoning by arsenic, phosphorus, and antimony, fatty degeneration of the liver, kidneys, etc., may occur within a few hours after the ingestion of the poison; and that in cases of general fatty degeneration of the organs the possibility of poisoning by these agents should be borne in mind.

SECOND DAY—WEDNESDAY, JUNE 12TH.

The Society was called to order at 9 A.M. After the business of the Society had been transacted, the reading of papers was resumed.

STRANGULATED HERNIA.

DR. C. N. CHAMBERLAIN presented a paper on a case of strangulated hernia, with remarks. He described a case upon which he successfully operated, after ill-judged and prolonged attempts at taxis had been made by others, and cathartics had been given. The writer clearly set forth the dangers which may arise from prolonged taxis and delay in cases of strangulated hernia before herniotomy is resorted to.

EARLY SYMPTOMS OF HIP DISEASE.

DR. E. H. BRADFORD, of Boston, read a paper on Early Symptoms in Hip Disease. The paper enforced the fact that muscular irritability is a sign of more importance than the presence or absence of pain in cases of hip disease. No joint can be considered healthy which presents evidences of muscular irritation. Such irritation causes contraction, especially of the adductors.

DR. S. W. FLETCHER discussed the topic of Filth and Typhoid Fever. He took the ground that filth alone does not cause typhoid.

DR. E. WIGGLESWORTH read a paper on the Metric System in Medicine.

DR. J. R. CHADWICK gave a short statement regarding the Boston Medical Library.

THE AWARD OF THE SOCIETY'S PRIZE.

It was announced that the Society's prize had been awarded to Dr. Thomas Dwight, of Boston, for an essay entitled "The Identification of the Human Skeleton: a Medico-Legal Study."

ANNUAL ADDRESS.

The annual discourse was delivered by DR. FRANCIS MINOT, of Boston, on the Importance of the Medical Profession to the Public. He referred to the prosperous condition of the Massachusetts Medical Society; to the advance that has been made in recent years in medical education—especially by the Harvard Medical School; to the fact that ere long a course of four years' study would be required before the degree would be conferred. He referred to the question of the admission of women to the medical school and to the Society. He noticed the defects in the law which allowed any person styling himself a physician to sign a death certificate. The evils arising from the heating of houses with furnaces or with steam were alluded to. The subject of school hygiene was noticed, and the address concluded by commending to the profession the Massachusetts Medical Benevolent Society.

At the conclusion of the address a vote of thanks was extended to the orator.

After the introduction to the Society of the President-elect at 1 o'clock P.M., the Society proceeded to the Music Hall to engage in the exercises of the anniversary dinner.

The next annual meeting of the Society will be held in Boston on the second Wednesday in June, 1879.

The following are the officers for the ensuing year: *President*, Dr. G. H. Lyman, of Boston; *Vice-President*, Dr. D. P. Smith, of Springfield; *Treasurer*, Dr. F. W. Draper, of Boston; *Corresponding Secretary*, Dr. C. W. Swan, of Boston; *Recording Secretary*, Dr. F. W. Goss, of Roxbury; *Librarian*, Dr. D. H. Hayden, of Boston. Orator for 1879, Dr. G. W. Garland, of Lawrence; Anniversary Chairman, Dr. C. C. Holmes, of Milton.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from June 9 to June 15, 1878.

BAILY, J. C., Major and Surgeon. To accompany troops ordered on campaign against the Bannock Indians in Southern Idaho; and to report in person to Major Geo. B. Sanford, 1st Cavy., at Kelton Station, C. P. R. S. O. 79, Div. of the Pacific and Dept. of California, June 8. 1878.

WILLIAMS, J. W., Major and Surgeon. Assigned to duty at Fort Sill, Ind. T. S. O. 102, Dept. of the Missouri, June 5, 1878.

BROWN, H. E., Capt. and Asst. Surgeon. Assigned to duty as Post-Surgeon at San Antonio, Tex., to date from June 4. S. O. 118, Dept. of Texas, June 7, 1878.

KOERPER, E. A., Capt. and Asst.-Surgeon. Assigned to duty with troops ordered from Camp Douglas, U. T., to temporary duty at Ft. Hall, Idaho. S. O. 50, Dept. of the Platte, June 5, 1878.

VICKERY, R. S., Capt. and Asst.-Surgeon. Leave of absence extended one month. S. O. 125, A. G. O., June 10, 1878.

PATZKI, J. H., Capt. and Asst.-Surgeon. To report in person to the Army Medical Board, New York City, for examination for promotion, and upon completion of examination, to the Comdg. General, Dept. of the East, for assignment to duty. S. O. 125, C. S., A. G. O.

KILBOURNE, H. S., 1st Lieut. and Asst.-Surgeon. Assigned to duty at Fort Riley, Kan. S. O. 102, C. S., Dept. of the Missouri.

BARNETT. R., 1st Lieut. and Asst.-Surgeon. Assigned to duty at Fort McKinney, Wy. T. S. O. 53, Dept. of the Platte, June 11, 1878.

WOOD, M. W., 1st Lieut. and Asst.-Surgeon. Assigned to duty at Fort McPherson, Neb. S. O. 53, C. S., Dept. of the Platte.

TAYLOR, M. E. 1st Lieut. and Asst.-Surgeon. To proceed to Santa Fé, and report to the Comdg. officer District of New Mexico, for assignment to duty. S. O. 105, Dept. of the Missouri, June 12, 1878.

THOMAS CARR JACKSON, F.R.C.S., formerly President of the Harveian Society, died in London on April 23d, at the age of fifty-five years. Mr. Jackson was an excellent surgeon, but he wrote very little. He was a born lithotomist, and was very successful in his operations, having cut twenty-eight patients without a death.

CALOMEL IN THE TREATMENT OF WORMS. — Dr. Walker believes that calomel is the best worm remedy for children. He reports a case of profuse fluor albus in a three-year-old child, which resisted all remedies, but finally healed after the expulsion of a coil of small worms. The worms were expelled after a single dose of calomel, consisting of ten grains.

ENURESIS OF CHILDREN.—In the chronic enuresis of children from six to twelve years of age, due to hyperæsthesia of the bladder, Dr. Vecchitti has employed chloral hydrate with excellent success. He administered it at bed-time, in doses of from nine to eleven grains.

TREATMENT OF WHOOPING-COUGH.—Dr. Orville, of Lille, has treated twenty-five cases of whooping-cough by the inhalation of carbolic acid from a wide-mouthed bottle. The bottle was held close to the mouth of the child as soon as the whistling inspiration of the attack began, so that the fumes of the acid were strongly inhaled. The results were satisfactory. (A carbolic spray would probably be better.)

TREATMENT OF HICCOUGH.—Dr. Favier reports a case of very obstinate hiccough that had lasted without interruption for fifty days, and was finally cured by compression of the epigastrium. The patient had been treated by blisters and sprinkling of the denuded cutis with morphine, by punctiform cauterization of the epigastrium with the hot iron, by injections of morphine, by ether, bromide of potassium, chloral, etc., all of which proved utterly useless. Finally, Dr. Favier determined to try the effect of forcible compression of the epigastrium by means of J. L. Petit's tourniquet. Five minutes after the instrument was applied the hiccough had ceased. It reappeared at first whenever the compression was suspended, but finally disappeared entirely. The Doctor adds, that as he had no electric apparatus he was unable to try the effect of faradization of the phrenic nerves.— *La France Médicale*, May 1st.

DR. JAMES ELNATHAN STEEL.—The late James Elnathan Steel, M.D., of this city, who died on May 28th, was born in Kidderminster, England, in 1828. His father, William Steel, was a Fellow of Oxford College, England, and his uncle, Richard H. H. Steel, of Birkenstead, England, was a surgeon for upward of fifty years in the Royal Navy. His nephew graduated from the New York Medical College in 1861, where his "Thesis on Anatomical Preparations" took the first prize. He was afterwards appointed Demonstrator of Anatomy in the same college. At the beginning of the war he accepted a position as surgeon in the volunteer corps, and was stationed at David's Island, Long Island Sound, where he won good opinions not only for his skill in operative surgery, but for his earnest and effective advocacy of conservative measures. He was afterward appointed surgeon in charge at Willett's Point, where he organized an army hospital. Afterward he was ordered to take charge and arrange an army hospital at Fair Oaks, near Troy. On returning to private practice he was appointed visiting physician to the Demilt Dispensary, which position he held for upward of seven years. He early became interested in scientific embalming, and commanded a large patronage in that line. For many years he was connected with the Masonic fraternity of New Rochelle and afterward of this city.

AMERICAN LARYNGOLOGICAL ASSOCIATION.—In response to a summons issued on May 10, 1878, a number of laryngologists from various parts of the United States came together at Buffalo on June 3d, for the purpose of forming an association for the advancement of the special department of medicine in which they were chiefly interested. Dr. F. H. Davis, of Chicago, acted as chairman, and Dr. Geo. M Lefferts, of New York, as clerk. After the purpose of the meeting had been stated by these gentlemen a permanent organization was formed, and a constitution and by-laws were framed. In the afternoon the following officers were elected: President, Dr. Louis Elsberg, of New York; Vice-President, Dr. F. H. Davis, of Chicago; Secretary and Treasurer, Dr. George M. Lefferts, of New York; Council, Drs. Clinton Wagner, of New York, William C. Glasgow, St. Louis, E. L. Shurley, Detroit, J. H. Hartman, Baltimore. The first annual meeting will be held in New York on the second Tuesday in June, 1879.

SIR JAMES COXE.—The medical profession of Scotland has lost one of its ablest members in the person of Sir James Coxe, M.D., Commissioner in Lunacy, who died recently at Folkestone, after a very short illness. He was on the way home from a tour on the continent, where he had been spending a short holiday. Sir James was born in 1811. In 1855 he was appointed one of the members of a Royal commission "to investigate the condition of lunatic asylums in Scotland," etc. He drew up the report of the commission, which was presented to Parliament in 1857, and led to the passing of an act establishing the General Board of Lunacy for Scotland, with Dr. Coxe and Dr. Browne as Medical Commissioners. Since that time he has been a most diligent member of the board, and to him, in a great measure, are due its highly satisfactory working and valuable results. The honor of knighthood was conferred on him in 1863. He was President of the Medico-Psychological Association in 1872, when it met in Edinburgh.

LOCAL TREATMENT OF THRUSH.—A writer in the *Canada Lancet* reports excellent results from using the following lotion in connection with appropriate constitutional remedies:

℞. Potass. chlor.,
Sodæ sulphitis,
Sodæ bibor., ää . . . . . ℥ jss.
Glycerinæ . . . . . ℥ ss.
Aquæ, *ad*: . . . . . ℥ ij.

UNIVERSITY MEDICAL COLLEGE.—Dr. L. A. Stimson, of this city, has been appointed Professor of Pathological Anatomy in the University Medical College; also one of the Curators to Bellevue Hospital.

BUFFALO LITHIA WATERS 28

ALWAYS SPECIFY "K. & M." GRANULATED EFFERVESCENT SALTS.

K. & M.

GRANULATED EFFERVESCENT

PEPSIN, BISMUTH, AND STRYCHNIA.

ORIGINATED BY KEASBEY & MATTISON.

We again offer this preparation confidently to the profession. It has for four years enjoyed an extensive prescription among the most eminent of our practitioners. Its use has been attended with the most marked success perhaps of any of the various remedies recommended in dyspepsia, gastralgia, and kindred disorders. Its association with Carbonic Acid renders it palatable, and causes it to be retained by the most sensitive stomach. It is the only soluble form in which Pepsin and Bismuth should be ever given together, and is FIVE TIMES THE PEPSIN STRENGTH of the various elixirs, wines, liquors, etc., of the market. In reference to its reliability, we refer to the most prominent physicians in all sections of this country, who will very generally be found to be using it in their practice.

Always prescribe the GRANULATED EFFERVESCENT form, and always specify the "K. & M." preparation.

Each drachm or heaping teaspoonful contains FIVE GRAINS Saccharated Pepsin, two grains soluble Citrate of Bismuth, and one-fiftieth grain Citrate of Strychnia.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 21, 1877.

Gentlemen.—I have used a large number of your preparations for several years past with great satisfaction, and am happy to commend them to others from what I know both of your drugs and of yourselves. Very truly yours, W. W. KERR, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE CAFFEINE.

ORIGINATED BY KEASBEY & MATTISON.

The recent extensive employment of this salt as a remedy, amounting almost to a specific in cases of sick headache, and its use in nervous diseases generally, have caused us to place it upon our list. Its value is much enhanced by its administration with Carbonic Acid, so agreeably and efficiently produced by this form.

A heaping teaspoonful, containing ONE GRAIN of Citrate of Caffeine, should be given in a sick headache, every hour or two before and during the paroxysms.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 27, 1877.

Gentlemen—It gives me pleasure to add my testimony in regard to your preparations, which I have used for a long time; they are thoroughly reliable. Truly yours, THOMAS G. MORTON, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE LITHIA.

In the effervescent form this chemical is administered in a peculiarly advantageous manner. Its association with Carbonic Acid renders it much less liable to disturb the stomach, while in strength it is greatly superior to Lithia Water. A valued diuretic and lithontriptic, its importance in the treatment of rheumatic, gouty, and analogous disorders can scarcely be over-estimated.

We have doubled the strength of this preparation, each drachm or heaping teaspoonful containing FOUR GRAINS of the chemically pure salt.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 25, 1877.

Gentlemen—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, M.D., *Secretary American Medical Association.*

K. & M.

Granulated Effervescent Preparations

Of Magnesium Citrate, Potassium Bicarb., Citrate, Benzoate, and Bromide; Lithium Benzoate and Carbonate; Cerium Nitrate and Oxalate; Bismuth Citrate (SOLUBLE), Pepsin, and Bismuth; Pepsin, Bismuth, and Iron, etc., etc., etc.; also the following

FOUGERA'S COMPOUND IODINIZED

COD LIVER OIL

Since the introduction of this oil in 1858 it has been found to be superior to all other kinds of Cod-Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod-Liver Oil, but also the **tonic, stimulant, and alterative** properties of **Iodine Bromine** and **Phosphorus**, which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod-Liver Oil.

Through its **increased curative action, FOUGERA'S COD-LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod-Liver Oil would fail entirely.

Fougera's Ready-Made Mustard Plasters.

A most useful, convenient, clean and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths:—Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll of 10 plasters each. DIRECTIONS.—Dip the plaster or plasters, a minute or two, in cold water; apply on the part, and cover with a band.

Fougera's Compound Iceland Moss Paste.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, &c. Wakefulness, Cough and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this paste.

Fougera's Iodo-Ferro-Phosphated Elixir of Horse-Radish.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of anti-scorbutic and aromatic plants, and acts as a **tonic, stimulant, emenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

QUINETUM PILLS

(Sugar-Coated.)

The name **Quinetum** was given by Dr. De Vry to the collective alkaloids obtained from Peruvian bark; it has been extensively used by physicians throughout Holland in cases where the salts of quinine had been habitually employed. Dr. H. J. Vinkhuysen, Physician to the Household of the King of the Netherlands, has closely observed its effects, and arrived at the following conclusions:

1. The action of Quinetum in cases of marked or larval malaria, and especially in rheumatic affections due to malarious influences, is incomparably greater than that of quinine.

2. The tonic action of Quinetum is similar to, and even greater than that of quinine.

3. The influence of Quinetum in chronic cases is greater than that of quinine.

4. Persons who are liable to suffer from the toxic effects of quinine, and who therefore cannot take it without the greatest discomfort, can take Quinetum without this unpleasant effect, and yet obtain a similar therapeutical result.

5. Quinetum never causes noises in the ears.

6. Quinetum does not produce the unpleasant and even dangerous symptoms of quinine when given during the fit, and may be taken during the fit without causing any unpleasant feeling.

7. In all forms of pure malarial intermittent fever, Quinetum has the same apyretic effect as quinine, but is less powerful and acts more slowly. It must therefore be given in large doses, and at longer intervals before the ague fit, than quinine.

8. The only malarious disease in which Quinetum cannot be employed in place of quinine, is in pernicious fever. Quinetum requires more time to act than quinine, and as rapidity of action is absolutely necessary in this disease, Quinetum cannot be used in it as a substitute for quinine.

These Pills may be obtained of Druggists, or will be sent by mail, post-paid, on receipt of price.

LONDON M'F'G CO.'S
ESSENCES OF MEATS.

For Invalids, Travelers, and Persons of Delicate Health.

ESSENCE OF BEEF,
ESSENCE OF MUTTON,
ESSENCE OF CHICKEN.

These Essences consist solely of the juices of the Finest Meats, extracted by a gentle heat, without the addition of water or any substance whatever. They contain, therefore, the most stimulating and exhilarating portions of Meats, calculated to invigorate the heart and brain **immediately**; being without any gelatinous injurious elements, which require solution.

They are very effective in cases of **Sea Sickness.** Persons contemplating a sea voyage, or water travel of any kind, will find the Essences invaluable as a nourishing and stimulating preparation. They will be retained by the stomach in very critical cases of illness, when the most carefully prepared soup is rejected. They are also used with very satisfactory results in **Children's** complaints. Our Essences are heavy liquids, and, when placed upon ice, take a jellified form, retaining the fine flavors of the meats, thus making them very refreshing and pleasant to the taste.

Taken Direct from the Can without any Preparation whatever.

USE A DRY SPOON AND LEAVE THE CAN PARTLY OPEN. WILL KEEP IN ANY CLIMATE.

FOR SALE BY ALL DRUGGISTS.

PREPARED ONLY BY THE

London Manufacturing Company,

77 and 79 Varick Street, NEW YORK.

THE LATEST IMPROVEMENT IN ATOMIZERS!

For Inhalation, Local Anæsthesia, and Antiseptic Surgery.

Price $4.50, with Handle, Metal and Glass Atomizing Tube.
With Apparatus for giving Fomentations to any part of the Body, **$6.00.**

All joints are hard-soldered. Every one is tested, and they cannot be injured by exhaustion of water or any attainable pressure. It does not throw spirts of hot water. A perfect safety-valve, guaranteed to remain in thorough working order, and never to stick; and connection for steaming any part of the body locally, complete it.

The Apparatus without the Atomizer,	$3.50
Antiseptic Atomizer, throwing spray for two hours,	10.00
Stand throwing the spray in any direction,	5.00 extra.

Perfect Steam Atomizer.

Perfect Croup Bottle,
For confining and conducting lime fumes and acid vapors in Croup and Diphtheria.

L is a tray with handle. O is a cup which is filled ¼ full of lime and with sufficient warm water; the lime slackens as soon as it becomes hot, and the fumes will escape through the nozzle. If acids are used, place them directly in cup P, so that the steam will pass through the fluids and evaporate them.

Price, complete, with Nozzle for Fomentation,	5.00
Atomizer and Croup Bottle combined,	$9.00

This apparatus consists of a large boiler four times the size of the atomizer, a steam distributor and a cloak, **price $6.00.**

If with nozzle for local application of steam to any part of the body, **$2.00 extra.** With box for carrying, 12 x 6 x 6 inches.

For sulphur baths a lamp to burn the sulphur is supplied, and also a rubber cloak to which is attached a rubber tubing for the purpose of conveying the fumes out of the room, making it a perfect sulphur bath for family use and office practice.

Price of the Sulphur Bath, **$11.00**; with nozzle for Local Applications, **$13.00.**

Medicated Steam Bath.

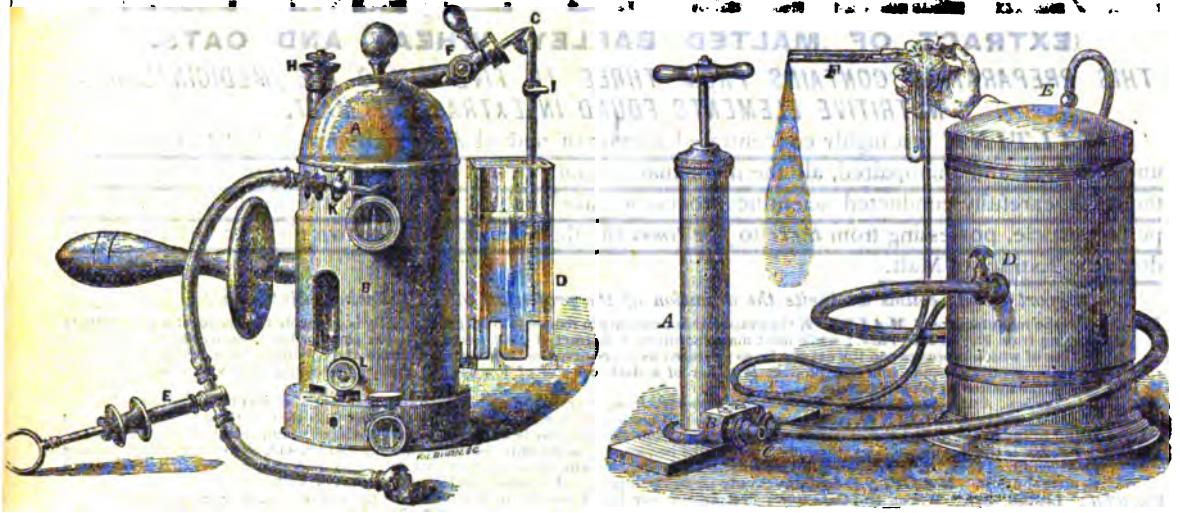
THE ANTISEPTIC ATOMIZER.



In this apparatus we have incorporated some of the best features of the Atomizing Apparatus heretofore made by us, already familiar to the profession. It is of best materials and workmanship—strong, durable, convenient, easily regulated, and by means of a new attachment of our own design, adequate without cessation of spray for any operation, or series of operations, however extended. Full description on application.

A NEW PAMPHLET

On Atomization of Liquids, with Formulæ of many articles of the Materia Medica successfully employed in the practice of a well-known American Practitioner, together with a description of the best forms of apparatus, will be sent post-paid on application. Also our new illustrated Catalogue of Surgical Instruments.

ATOMIZING APPARATUS BY COMPRESSED AIR.

This apparatus will be found entirely satisfactory on account of its elegance and perfect working qualities. It has a double acting Brass Pump (condensing or exhaust, at will), with valves unchangable by time or use. Strong Copper Receiver, Nickel Plated, 12 feet, light and flexible but strong; brown-colored Tubing and a self-closing cut-off (our own design, represented at I), readily connected with any tubes now in use.

PRICES REDUCED.

The Complete Atomizer	**$5.00**	**Clarke's Atomizer**	**$3.00**
Dr. Oliver's "	**4.00**	**The Constant "**	**3.00**

TO THE MEDICAL PROFESSION.

MALTINE.

(EXTRACT OF MALTED BARLEY, WHEAT AND OATS.)

THIS PREPARATION CONTAINS FROM THREE TO FIVE TIMES THE MEDICINAL AND NUTRITIVE ELEMENTS FOUND IN EXTRACT OF MALT.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat* and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST: In the manufacture of ***MALTINE*** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates and Albuminoids on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity possessing little virtue aside from the saccharine matter which it contains.

SECOND: *Carbon, Hydrogen, Nitrogen, Phosphorus, Sulphur, Iron, Magnesium* and *Potassium* are essential elements in the food of man; and it is only in ***MALTINE***, containing the combined properties of malted *Barley*, *Wheat* and *Oats* that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD: *Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. ***MALTINE*** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH: LIEBIG says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley in the manufacture of ***MALTINE*** is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of ***MALTINE****, and would request a trial and comparison of merits with any article offered for similar uses.*

MALTINE AND ITS COMPOUNDS

Can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULAS AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS AND ON THE LABEL ATTACHED TO EACH BOTTLE:

MALTINE WITH HOPS.

MALTINE FERRATED:
This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

MALTINE WITH PHOS. IRON AND QUINIA:
A powerful general and nutritive tonic.

MALTINE WITH PHOS. IRON, QUINIA AND STRYCHNIA:
A powerful nutritive, general and nervous tonic.

MALTINE WITH HYPOPHOSPHITES:
This preparation is specially indicated in Phthisis, Rickets and deficient Ossification.

MALTINE WITH PEPSIN AND PANCREATINE:
One of the most effective combinations in Dyspepsia, Cholera Infantum and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the ***MALTINE***. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

MALTINE WITH BEEF AND IRON:
One of the most valuable combinations in cases of general Debility, when there is deficient nutrition and a deficiency of Iron in the system.

MALTINE WITH COD LIVER OIL:
The most perfect emulsion, and most agreeable and effective mode of administering this nauseous but valuable Oil yet discovered.

MALTINE WITH COD LIVER OIL AND PHOSPHORUS:
In this combination the Phosphorus has no irritant effect upon the stomach.

MALTINE WITH COD LIVER OIL AND IODIDE OF IRON:
This is prepared with the tasteless Iodide of Iron, which undergoes no chemical change from contact with the Oil, and does not blacken the teeth.

MALTINE WITH ALTERATIVES:
In this preparation ***MALTINE*** is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioner in Syphilis, Scrofula, and all depraved conditions of the blood.
Each fluid ounce contains: *Chloride Calcium*, 10 grains; *Chloride Magnesium*, 10 grains; *Bromide Sodium*, 5 grains; *Iodide Potassium*, 1 grain; *Iodide Iron*, ¼ grain. DOSE, One teaspoonful to one tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only*.

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in amber bottles holding sixteen fluid ounces; each bottle inclosed in a folding paper box.

REED & CARNRICK, Manufacturing Pharmacists,

196 and 198 Fulton Street, New York.

WYETH'S DIALYSED IRON.

(FERRUM DIALYSATUM.)

A Pure Neutral Solution of Peroxide of Iron in the Colloid Form. The Result of Endosmosis and Diffusion with Distilled Water.

PREPARED SOLELY BY

JOHN WYETH & BRO.,

PHILADELPHIA.

This article possesses great advantages over every other ferruginous preparation heretofore introduced, as it is a solution of Iron in as nearly as possible the form in which it exists in the blood. It is a preparation of invariable strength and purity, obtained by a process of dialysation, the Iron being separated from its combinations by endosmosis, according to the law of diffusion of liquids. It has no styptic taste, does not blacken the teeth, disturb the stomach, or constipate the bowels.

It affords, therefore, the *very best* mode of administering **IRON** in cases where the use of this remedy is indicated.

The advantages claimed for this form of Iron, are due to the absence of free acid, which is dependent upon the perfect dialysation of the solution. The samples of German, French, and American Liquor Ferri Oxidi Dialys., which we have examined, give acid reaction to test paper If the dialysation is continued sufficiently long, it should be tasteless and neutral.

Our Dialysed Iron is not a saline compound, and is easily distinguished from Salts of Iron by not giving rise to a blood-red color on the addition of an Alkaline Sulpho-Cyanide, or a blue precipitate with Ferro-Cyanide of Potassium. It does not become cloudy when boiled. When agitated with one part of Alcohol and two parts of Ether (Fortior), the Ether layer is not made yellow.

Physicians and Apothecaries will appreciate how important is the fact that, as an antidote for poisoning by Arsenic, Dialysed Iron is quite as efficient as the Hydrated Sesquioxide (hitherto known as the best remedy in such cases), and has the great advantage of being always ready for immediate use. It will now doubtless be found in every drug store to supply such an emergency.

FULL DIRECTIONS ACCOMPANY EACH BOTTLE.

Physicians will find our DIALYSED IRON in all the leading drug stores in the United States and Canada.

It is put up in bottles retailing for ONE DOLLAR, containing sufficient for four months' treatment. Large size is intended for hospitals and dispensing. Retail at $1.50. Price Lists, etc., etc., sent on application.

JOHN WYETH & BRO.

WYETH'S COMPRESSED TABLETS OF CHLORATE OF POTASH.

For Hoarseness, Bronchial Irritation, Sore Throat, Diphtheria, Croup, etc., etc.

Chlorate of Potash is a remedy of acknowledged value in cases of Diphtheritic Sore Throat, and in Inflammation of the Mouth and Throat, induced by a depressed state of the system. In these instances, as in the milder forms of Croup, it has, besides its depurative and detergent effects, a solvent action on the deposits, characteristic of those troublesome and dangerous affections. It relieves Hoarseness; and in many cases of Fetid Breath from disordered secretions, it proves an efficient corrective. Its virtues in simple Angina, or ordinary Sore Throat, are recognized by many of the most eminent physicians.

As the taste of this article is not disagreeable, we have prepared it in the form of Compressed Tablets, thus giving the patient the full benefit of its action, undiluted with Sugar, Gum, or other vehicles, which would not only prevent its effects, but which sometimes themselves offend the stomach.

The Lozenges usually contain about twenty-five (25) grains of gum and sugar, with two grains of the Chlorate of Potash, while each of these Tablets contains simply five grains of the Chlorate, all of which, dissolved in the saliva, acts on the affected mucous membranes.

If allowed to dissolve in the mouth, the topical effect is much more efficient than a saturated solution, as while the solution is but temporary, the tablet really acts as a continuous gargle.

FOR SORE THROAT, HOARSENESS.

DIRECTIONS.—Adults should take one every hour or two until relieved, allowing it to dissolve slowly in the mouth. Children, half of one as often.

For Offensive Breath, no remedy will give more certain relief; use one, two or three times a day.

For Diphtheria, Croup, and the more serious ailments, the physician should direct.

PEPTONIC PILLS.

Pepsin, Pancreatin with Lacto-Phosphate of Lime and Lactic Acid.

(COPYRIGHT SECURED.)

This pill will give immediate relief in many forms of Dyspepsia and Indigestion, and will prove of permanent benefit in all cases of enfeebled digestion, produced from want of proper secretion of the Gastric Juice. By supplementing the action of the stomach, and rendering the food capable of assimilation, they enable the organ to recover its healthy tone, and thus permanent relief is afforded. One great advantage of the mode of preparation of these pills is the absence of sugar, which is present in all the ordinary Pepsin and Pancreatin compounds. In this form, the dose is much smaller, more pleasant to take, and is less apt to offend the already weak and irritable stomach. The results of their use have been so abundantly satisfactory, that we are confident, further trial will secure for them the cordial approval of the Medical Profession and the favor of the general public.

Each pill contains one grain of pure PEPSIN, and one of pure PANCREATIN, which is equivalent to 10 grains of the ordinary or Saccharated usually prescribed and dispensed. Physicians will appreciate the great advantage of this mode of administration. The increased benefit to the dyspeptic, being due to a full and effective dose of each, freed from the unnecessary bulk, and really hurtful addition of sugar. A single pill will give immediate relief.

DIRECTIONS.—Take one pill immediately after eating or when suffering from Indigestion, Lump in the Throat or Flatulence. For children, reduce the pill to powder and give one-fourth or half, according to age.

JOHN WYETH & BRO., Chemists, Philadelphia.

☞ *Please mention MEDICAL RECORD.*

JOHNSTON'S FLUID BEEF.

The subscribers solicit the special attention of Physicians to the exceptional merits of the above preparation as a resuscitating stimulant, in a form capable of digestion and assimilation by the feeblest invalid or infant.

It is well known in the profession that Meat Extracts are simply "the soluble salts of flesh," and, as such, have desirable stimulative qualities, but that *the elements of nutrition are wanting.*

Baron Liebig, in the *Lancet* of November 11, 1865, says:—

"Were it possible to furnish the market at a reasonable price with a preparation of Meat combining in itself the albuminous together with the extractive principles, such a preparation would have to be preferred to the "Extractum Carnis," for it would contain ALL the nutritive constituents of Meat." Again: "I have before stated that in preparing the Extracts of Meat the Albuminous principles remain in the residue; they are lost to nutrition; and this is certainly a great disadvantage."

JOHNSTON'S FLUID BEEF is a combination of the extractive and proteine principles which will at once recommend itself to all capable of judging. In its manufacture, the Beef is first treated so as to obtain the Albumen and Fibrine in a separate and highly concentrated form: then, with the view of securing easy digestion by presenting a greatly increased surface to the action of the gastric juice, these nitrogenous compounds are reduced to a powder capable of suspension in water, which, added to Extract of Meat, procured upon the most approved principles, furnishes the entire constituents of Beef in a condition which the most feeble stomach can readily digest and assimilate, thus, with the least possible expenditure of vital force, *supplying to the blood all that is necessary to impart tone to the nerves and substantial food for brain bone and muscle.*

From the "modus operandi" it will be seen that the preparation is no untried chemical compound, but simply animal food so treated as to secure a facility of digestion and assimilation hitherto unattainable, and this in combination with all the stimulating properties of the most approved extracts and a more acceptable flavor, The preparation is in use in the leading hospitals (being generally prescribed by the British Medical Faculty), and has been popularly accepted wherever it has been introduced.

EXTRACTS FROM REPORTS BY LEADING AUTHORITIES.

It is one of the most perfect foods I have ever examined.—W. HARKNESS, F.C.S.L., *Analyst to the British Government.*

This is a highly nutritious article of diet, contains all the elements of Flesh Food in a concentrated form, is very palatable and easily digested, and is eminently suited for dietetic purposes, especially for invalids.—STEVENSON MACADAM, Ph.D., F.R.C.S., F.C.S., Edinburgh.

It is a great boon both to the invalid and to the public.—Professor MILLAR, Edinburgh.

I can very strongly recommend Johnston's Fluid Beef.—Professor CHARLES CAMERON, Dublin.

I fully expect that it will ere long take precedence both in professional and public favor of all articles of a like kind, as it possesses qualities superior to all of them.—Dr. SMART, Edinburgh.

It is the most perfect food I know of for invalids, and is especially useful in the diarrhœa of children.—ED. WORTHINGTON, F.R.C.S., Edinburgh.

As a stimulative and recuperative agent "Johnston's Fluid Beef" has a very general adaptation, and there are few bodily ailments where it could not be prescribed with advantage. We may, however, specialize all affections of the Alimentary Canal, notably "Cholera Infantum," and general lack of vitality. It is also invaluable in convalescence, lactation, and as a substitute for alcohol.

Physicians will be furnished with samples, gratis, on application to

COSMOLINE

[Unguentum Petrolei]

Sample Furnished on application.

The Post-Office Laws forbid anything of an oleaginous nature being sent through the mails.

THEOPHILUS REDWOOD, Ph.D., F.C.S., Professor of Chemistry and Pharmacy to the Pharmaceutical Society of Great Britain, says in reference to this preparation:—

"UNGUENTUM PETROLEI appears to be obtained from crude Petroleum by fractional distillation and subsequent purification. Products of a similar description have been introduced in pharmacy, and recommended as substitutes for animal or vegetable fats in the preparation of ointments or liniments.

"Among these, the UNGUENTUM PETROLEI is distinguished by its having a firmer consistence and a higher melting point, and in these respects it resembles pure lard, from which it differs in that it is entirely free from liability to become rancid or to undergo any chemical change. It has an amber color and a smooth, jelly-like appearance, and is almost wholly free from odour or taste. It is free from, and insoluble in water. It is very slightly soluble in rectified spirit, but very soluble in ether, in fixed oils and fats. I am of opinion that its characters and properties are such as to render it a valuable adjunct to our *Materia Medica.*"

Dr. TILBURY FOX, [London,] writes:—"I like the UNGUENTUM PETROLEI very much indeed, and shall not fail to prescribe it."

THE LANCET ANALYTICAL REPORT ON UNGUENTUM PETROLEI.

From the LANCET, London. October 20th, 1877.—UNGUENTUM PETROLEI.—Simi-transparent, pale yellow in colour, and perfectly free from offensive smell. We consider it a valuable preparation, and hope its use will become as common in England as it is said to be in America."

From the MEDICAL TIMES AND GAZETTE, London, October 20th. 1877.—"The substance introduced under the name of UNGUENTUM PETROLEI is of about the consistence of good lard, has no smell, keeps any length of time, apparently, without becoming rancid, and may be exposed to any kind of atmosphere without undergoing chemical change. It has long been, we understand, in use in America, where it enjoys a wide-spread popularity; and it will, we doubt not, come into extensive use here also as a vehicle for making ointments, as a demulcent in various diseases of the skin, and as a lubricant."

Prepared by E. F. HOUGHTON & CO., 211 South Front St., Philadelphia.

BLATTA ORIENTALIS,

The New Russian Remedy for Dropsy.

It is said to increase both urine and perspiration with almost complete disappearance of albumen; it does not, like Spanish Fly, produce irritation of the kidneys.

Dose.—From 15 to 30 grains, in powder or infusion, 3 to 4 times a day.

Dr. BOMOGOLOFF, Surgeon-General of the Russian Army; Dr. BODKIN, Physician to Her Majesty the Empress of Russia, and a number of European Physicians, have attested its efficacy.

MATTONI'S

Royal Hungarian Bitterwater,

warmly recommended by the leading medical capacities at home and abroad, in cases of HABITUAL CONSTIPATION, and against all diseases resulting therefrom, WITHOUT ANY ILL EFFECTS ON THE BODY, even if used for a longer period. This water distinguishes itself in a most remarkable manner, on account of its rich contents of Chlornatron, Natron Bicarbonicum, and Natron Carbonicum, and for this reason deserves to be preferred to all other bitterwaters.

MATTONI & WILLE,

Purveyors to the Imperial Austrian Court, Proprietors of the six combined Royal Hungarian Bitterwater Springs of the City of Ofen.

THE BEST IS THE CHEAPEST.

"IN Burr's improved Nursing Bottle all objections have been successfully overcome."

BURR'S Nursing Bottles

have been recommended and indorsed by all the leading Physicians and Druggists for the past ten years.

They are made of the very best and purest material, and by the most skilful workmen.

Nursing bottles and tubes should be thoroughly cleansed immediately after using. This is of the greatest importance, as the life of the infant depends on it.

It is almost impossible to get at the tube of the imitation Nursing Bottles in order to clean them. Carelessness in this respect is to be carefully guarded against, and the mother should look to it that this advice is followed. Restlessness, gastric irritation, griping pains and fits of screaming are the consequences of neglecting this matter, and ignorant people blame the bottle, when these results should be attributed to the carelessness of the nurse and want of cleanliness of the bottle and tubes.

In the genuine BURR'S IMPROVED NURSING BOTTLE, the nipple-holder tube-connector and mouth-guard are all ingeniously combined in one piece of hard, polished wood. It is so constructed that the nipples are very firmly held, yet they can be easily taken off for cleaning the tube and replaced in an instant.

AVOID DANGER

And all nursing bottles where the nipple-holder, mouth-guard and tube-connector are of metal, or in more than one piece.

The genuine Burr's Improved Nursing Bottles are made in eight different styles, and retail at from twenty-five to seventy-five cents.

See that the patent stamps are on the mouth-guard and stopper, and that the words "Burr's Patent Nursing Bottle" are blown in each bottle.

M. S. BURR & CO., Manufacturers, 486 Tremont St., Boston, Mass.

Western Electric Manufacturing Co.

MANUFACTURERS OF

Electro-Medical Instruments and Batteries,

FARADIC MACHINES,
GALVANIC BATTERIES,
BATH APPARATUS, &c.

Sole Manufacturers of

Dr. Byrne's Perfected Galvanic Battery for Electro-Cautery

The only apparatus of the kind for which a special award was granted at the Centennial Exhibition in accordance with the Reports of Sir William Thomson and Professor Henry, based upon actual experiments.

It embraces the very latest and best improvements, and is by far **the most complete and powerful instrument yet devised for galvano-cautery operations.** It consists of 4 cells in a neat case 8½ x 7¼ x 4½. **Its heating capacity is fifteen inches of No. 21 Platinum wire, or twenty inches of No. 18,** and it will maintain a current available for surgery during half an hour without change of fluid.

The weight of the entire battery is ten pounds. It is, therefore, conveniently portable and **the most efficient and reliable battery for galvano cautery yet offered to the profession.** Its distinctive peculiarity consists in the negative plate by which much greater power is obtainable than from carbon or Platinum, while they are equally indestructible with the latter. **These plates (patented) are also specially adapted for all battery organizations requiring great quantity and a high electro-motive force,** as for Electro-Plating, Electro-Motor for Sewing Machines, discharging explosives, etc.

WESTERN ELECTRIC MANUFACTURING CO.

20 New Church St., NEW YORK. 220 to 232 Kinzie St., CHICAGO.

L. REICH,

DIRECT IMPORTER OF THE CHOICEST AND PUREST

HUNGARIAN WINES

EVER BROUGHT TO THIS COUNTRY,

STRICTLY FOR MEDICINAL USE,

Respectfully informs the members of the Medical Profession that he has opened an office at

13 West 11th St., New York.

Those of the Medical Profession who may desire to avail themselves of the opportunity of procuring **STRICTLY FIRST-CLASS WINES,** which have received the endorsement of the most eminent Medical men of the country, as is evidenced from the following letters of commendation which have been received:

This is to Certify, that I have examined Mr. L. REICH's TOKAYER AUSBRUCH, TOKAYER MASLAS, and BUDAI IMP. I take great pleasure in commending these Wines to the Medical Profession because of their purity.

R. OGDEN DOREMUS, M.D., LL.D.
Prof. of Chemistry and Toxicology in Bellevue Hospital Med. Col., and Prof. of Chemistry and Physics in Col. City of New York.

We have used in our practice the Hungarian Wines sold by Mr. LORENZ REICH, who puts them on the market unadulterated, just as they are imported. To this fact we attribute their great value as a medicine in diseases where such tonics are indicated, especially in those which are attended by defective digestion and imperfect assimilation. We cordially recommend Mr. Reich and his Wines to our professional brethren.

This school was organized in 1872. In the arrangement of its curriculum, special reference has been had to the increasing demand for a more thorough and systematic culture than is usually given in American Medical Colleges.

Experience having shown it to be impossible to present even the essentials of medicine in a series of lectures extending through four or five months, the course in this school has been graded and extended to meet the varied needs of students.

The College Year begins on the first Thursday in October, and ends on the second Thursday in June. It is divided into two terms nearly equal in length. There is a vacation of two weeks between the terms.

The studies are divided into those of the first, the second and the third years.

1st Year Studies—Anatomy; Physiology; General Chemistry; Histology and Botany.

2d Year Studies—Continuation of Anatomy and Physiology; Medical Chemistry; Materia Medica; Practice; Surgery; Clinical Medicine and Surgery.

3d Year Studies—Materia Medica; Practice; Surgery; Clinical Medicine and Surgery; Obstetrics; Diseases of Children; Forensic Medicine; Gynecology and Ophthalmology.

Instruction is given by lectures, recitations and frequent and various practical exercises. Students of the first year are taught the use of the microscope and practical histology, and receive a thorough course in analytical chemistry.

Botany is taught during the second term of the first year.

To students of the second and third years all necessary facilities for clinical instruction are afforded by two good hospitals and the *College Dispensary*.

This school makes no distinction as to sex. Women and men receive precisely the same instruction. The system of co-education has been pursued since the school was organized *with results that fully warrant its* continuance.

Examinations are frequent and thorough. Students who join the school for the regular course are examined as to their qualifications for the study of medicine, unless they present evidence of scholarship from some creditable source. At the end of the second year final examinations are given in Anatomy, Physiology and Chemistry.

Students at home or in an office who may desire to join our second year will come prepared for examination on the bones and muscles in Anatomy; on nutrition, in Dalton's Physiology; and on the inorganic part of Attfield's Chemistry.

☞ Students who do not intend to become candidates for the degree may be received at any time and make their own choice of studies. A certificate of time will be given on application to the Registrar.

Requirements for Graduation.—Twenty-one years of age; good character; three full years of medical study; one continuous year at this school, and *satisfactory examinations*. Thesis not required.

FEES AND EXPENSES.

For Matriculation	**$5 00**	**For Graduation**	**$25 00**
Tuition for the Year	**100 00**	**Demonstrator's Fee**	**5 00**
For either Term alone	**65 00**		

The fee for the third year to students who have fully paid the first and second years will be $50.00.

Students in the Chemical Laboratory will be charged $5.00 per term for Laboratory expenses.

Students not in the regular course, receiving instruction in one or two branches, are charged, after matriculation, $18.00 per term for a single study.

Board may be obtained for $3.50 and upwards.

For other information, address the Registrar,

WM. T. PLANT, M.D., Syracuse, N. Y.

Trommer's Extract of Malt.

The rapidly increasing demand for our **IMPROVED EXTRACT OF MALT**, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantity; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or molding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made, is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The Extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops,** viz.: **Malt Sugar, Dextrine, Diastase, Resin and Bitter of Hops, Phosphates of Lime and Magnesia, and Alkaline Salts.**

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:

Malt Sugar, 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712; Alkalies, .377; Water, 25.7. Total, 99.958.

In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article. Yours truly, SILAS H. DOUGLAS,

Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt, contains a larger quantity of the active properties of Malt, than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ lbs. of the Extract.

Our preparations of Malt are for sale by druggists generally throughout the United States and Canadas, at the following prices:

EXTRACT OF MALT,			**With Hops (Plain),**	**$1 00**

NELATON'S CATHETERS,

Sometimes called Jacques', but really the invention of Dr. Nélaton, Surgeon to the late Emperor Napoleon III., have, by their decided advantages over every other kind, become a necessity in the practice of the leading Physicians and Surgeons of Paris, London, and other European Cities.

Their introduction here has been so successful that imitations are already in the market, much inferior in quality. Having secured a large stock from the original manufacturers during my stay in Paris, I am enabled to offer the genuine at a reasonable price.

These are made of *pure brown rubber*, with a smooth, soft surface, delicately flexible; and if the simple directions on the box are followed, their introduction will cause little or no pain, and effect their purpose much more easily and effectively than any other kind.

Sets of nine sizes, numbered and with wire, the whole neatly boxed, will be sent by mail on receipt of $6.00. THEO. RICKSECKER, 146 & 148 WILLIAM ST., NEW YORK.

PERFECTION SPONGE TENTS.

These Tents are the *very best in market;* in *quality of sponge, method of manufacture, strength, utility*, and *medication.*

The many complaints by the Profession against those commonly sold have encouraged the sale of the "Perfection," which will be sent in boxes of one dozen, assorted, by mail, on receipt of $2.50.

The maker holds letters of approval and recommendation from the following eminent Physicians

J. Marion Sims, M.D., N. Y., | Washington L. Atlee, M.D., Phila.,
T. Gaillard Thomas, M.D., N.Y., | W. Byrne M.D., Brooklyn.

Recommend to the Profession and Trade especially

CARLSBADER SPRING WATER,

AND OTHER PRODUCTS OF THE SPRING.

According to our latest contracts with the proprietors of the different Carlsbad Spring, we get fresh shipments with every steamer, so as to be able to supply this water in a quality not to be had formerly. Carlsbad Water, and especially the

SPRUDEL, SCHLOSS (Castle), THERESIA, MUEHL (Mill) SPRING,

Are to-day relied on by the Medical Profession in Germany, as the surest remedy in Diabetes, Diabetes Melitus, and Diseases of the Kidneys.

They are likewise used as a specific almost **for reducing Obesity.**

They are a mixed alkaline, saline water of reliable healing quality in Liver and Bowel Complaints, and Diseases of the Prostate Gland.

Sold, **ALWAYS FRESH,** only by us. For price and other information, please send for Pamphlet on Mineral Waters. Special Quotations on quantities.

Carlsbad Sprudel Salt may be used either to assist the effects of the Carlsbad Water or as a remedy by itself. In the latter case the dose is one or two teaspoonfuls, either in a dry state or dissolved in water.

It dissolves rapidly and completely in warm water, and in this form a curative effect may be expected with more certainty. It is advisable to use water at a temperature of 30° to 40° R. This, however, does not exclude its being taken with cold water. The best time for taking the salt is in the morning, shortly before breakfast, fasting.

CARLSBAD SPRUDEL SOAP, for Psoriasis, Eczema, and Chronic Dermatoses, always on hand.

CARLSBAD SPRUDEL LOZENGES, representing in a light degree the qualities of the water, always on hand, FRESH IMPORTED.

MY PREPARATION OF FLUID EXTRACT OF DAMIANA has now been before the profession for a term of about eighteen months. Its introduction has been retarded and injuriously affected from the fact, that several large houses in N. w York, not counting other concerns outside of it, have sold during all this time, so-called Damiana Extract, which is not made from the true plant, and that many physicians, who have heard favorable reports from my preparation have failed to obtain like results from other makes. I have therefore offered, an I repeat it here, that I am willing to give or send (expressage unpaid) to any physician asking for it, a one ounce sample of this Fluid Extract for the sole purpose of showing at the first glance that my preparation is different from that of other makers. This is not intended to be sufficient for a physiological test, but simply as a specimen.

According to the reports so far gathered by me, Fluid Extract of Damiana has a most decided *tonic action* on the urinary and uterine organs, and in its intensity of action, is superior to any other known remedy.

It acts with almost specific effect in *prostatitis and spermatorrhœa.* Cases of gleet that yielded to no other treatment have been cured by it. Cystitis has been very successfully treated with Damiana, and there is no drug equal to it in allaying weakness of the bladder and the frequent desire to urinate. In *nervous exhaustion* especially produced by brain labor and over work, it is superior to Quinine, and many patients who have habitually used the former derive greater and more lasting benefit from the Damiana. Several physicians have thought it incongruous that an aphrodisiac should be likewise a remedy for spermatorrhœa; but experience has shown that the tonic action of the drug is employed in curing the debility very much like the effect of morphia, which, when used where there is great pain, first subdues the pain before producing sleep, and if its powerful and lasting tonic action is considered, the effect of the Damiana as an aphrodisiac is physiologically explained. It has been given with very good effect by some of the best known Gynæcologists in *Dysmenorrhœa and Leucorrhœa* although no reports have been published as yet, and it appears to be of great value in atonic ovarian diseases.

NITRITE OF AMYL PEARLS,

of 2, 3, 5, 8 and 10 drops, exactly dosed, *warranted not to burst,* made according to a new process, and largely used in *sea sickness.*

WARBURG'S TINCTURE,

pronounced by all the members of the profession as the most reliable made, and used in all cases of *Malaria, Intermittent Fevers, Ague,* and the complications arising from such cases where Quinia does not act.

1 oz. Bottles, $6 per doz., or $5 per lb.

IODOFORM CRAYONS, for ulceration of the cervix.

ERGOT CRAYONS, for uterine diseases, $1 per doz.

POWDERS OR PILLS, made by compression.

SUPPOSITORIES, made cold by compression.

BOUGIES of Tanin, Sulphate of Zinc, or any combinations made cold by compression, while the *patient waits.*

THE COLLEGIATE YEAR is divided into three Sessions: A Preliminary Session, a Regular Winter Session, and a Spring Session.

THE PRELIMINARY SESSION will commence September 18, 1878, and will continue until the opening of the Regular Winter Session. It will be conducted on the plan of that Session.

THE REGULAR WINTER SESSION will commence on the Second of October, 1878, and end about the 1st of March, 1879.

The location of the new College edifice being immediately opposite the gate of Bellevue Hospital, and a few steps from the ferry to Charity Hospital, Blackwell's Island, the Students of the University Medical College are enabled to enjoy the advantages afforded by these Hospitals, with the least possible loss of time. The Professors of the practical Chairs are connected with the Hospitals, and the University Students are admitted to *all the Clinics* given therein, *free of charge.*

In addition to the daily Hospital Clinics, there are eight Clinics each week in the College building. Five Didactic Lectures will be given daily in the College building, and Evening Recitations will be conducted by the Professors of Chemistry, Practice, Anatomy, Materia Medica, &c., Physiology, Surgery and Obstetrics, upon the subjects of their Lectures.

THE SPRING SESSION embraces a period of twelve weeks, beginning in the first week of March and ending the last week of May. The daily Clinics, Recitations and Special Practical Courses will be the same as in the Winter Session, and there will be Lectures on Special Subjects by the Members of the Post-Graduate Faculty.

THE DISSECTING ROOM is open throughout the entire Collegiate year; material is abundant, and it is furnished free of charge.

STUDENTS WHO HAVE STUDIED TWO YEARS may be admitted to examination in Chemistry, Anatomy and Physiology, and if successful, will be examined at the expiration of their full course of study, on Practice, Materia Medica and Therapeutics, Surgery and Obstetrics; but those who prefer it may have all their examinations at the close of their full term.

FEES.

For Course of Lectures	$140 00
Matriculation	5 00
Practical Anatomy Fee, including material for dissection	10 00
Graduation Fee	30 00
Post-Graduate Certificate	30 00

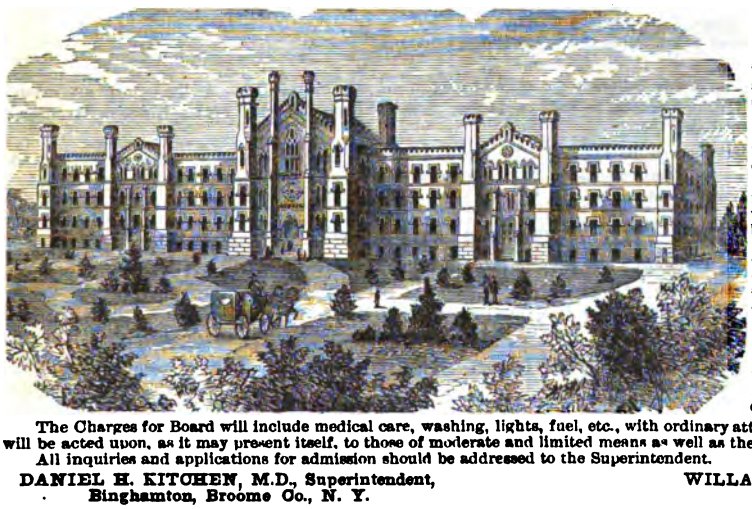
Formerly of Northampton Lunatic Hospital. Ex-President Hampshire Medical Society.

NEW YORK STATE INEBRIATE ASYLUM,



Binghamton, Broome County, N. Y.

This Asylum is admirably situated, overlooking a fine section of country, and is complete in all the appointments of a first-class home, with ample means to meet the wants of every case. It is located three miles from the city, and removed from all temptation. Its management is the same as all other State charities, under the control of a Board of Managers appointed by the Governor. The law provides for the maintenance of indigent inebriates, similar to that of the insane, but patients from other States may be admitted.

The experience of this Asylum, for the past ten years, indicates an increasing usefulness and necessity for such institutions, and the original intention of making this an Asylum Hospital, where this disorder may be thoroughly understood and treated on broad scientific principles is nearer realized than ever before. All rules are strictly enforced, and no patient permitted to go beyond the Asylum grounds without permission from the Superintendent, or in the care of an attendant.

The Charges for Board will include medical care, washing, lights, fuel, etc., with ordinary attention. The exigencies of each particular case will be acted upon, as it may present itself, to those of moderate and limited means as well as the rich.

All inquiries and applications for admission should be addressed to the Superintendent.

DANIEL H. KITCHEN, M.D., Superintendent,
Binghamton, Broome Co., N. Y.

WILLARD PARKER, M.D., New York, N. Y.,
President Board of Managers.

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

MEMBER OF THE AMERICAN MEDICAL COLLEGE ASSOCIATION.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878-1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures upon special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and ords as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, JR., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consist chiefly of Recitations from Text-Books. This term continues from the first of March until the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the Faculty. Regular clinics are also given in the Hospital and in the College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

C. C. YEMANS, M.D.,
Lecturer on Chemistry.

JAS. D. MUNSON, M.D.,
Demonstrator of Practical Physiology.

E. A. CHAPOTON, M.D.,
Demonstrator of Practical Microscopy.

The Collegiate Year is divided into three sessions.

PRELIMINARY SESSION opens Wednesday, September 4th, 1878, and continues one month. The Clinics are held and the Lectures delivered by the Professors of the regular Faculty, and in the same order and frequency as during the Winter Term. Opportunity is given to dissect or work in the Chemical and Physiological Laboratories.

THE REGULAR SESSION opens Wednesday, October 2d, 1878, and continues five months. During this term all the branches of *General Medicine* and *Surgery*, both scientific and practical, are taught with care and thoroughness. All students are daily examined on the subjects of the lectures and on their dissecting and laboratory work.

Senior students have *daily practice* in the *art of examining patients*, in forming their own diagnosis, prognosis and treatment. As this is done under the direction of the professor holding each clinic, and in the presence of the class, it constitutes an invaluable course of training.

THE RECITATION SESSION begins second Wednesday in March, 1879, and continues four months. Daily during this term there will be held a lecture, recitation and one or two clinics. The lectures will be upon special subjects of medical or surgical interest.

The recitations will embrace the general subjects of the Regular Session, viz., Anatomy, Surgery, Midwifery, Diseases of Women, Physiology, Practice of Medicine, Materia Medica and Chemistry.

Though the Recitation and Preliminary Sessions are optional, it is hoped that all who can, will avail themselves of their manifest advantages in supplementing the regular winter course.

Three Hospitals—Harper's, St. Mary's and St. Luke's—with two large free dispensaries, afford an abundance of clinical material for illustrative and practical teaching.

All lectures are delivered on Hospital grounds. The *peculiar feature* of this school is the *intimate union* between its *laboratory*, *clinical* and *didactic* instruction.

FEES

FOR PRELIMINARY AND REGULAR SESSIONS:

Matriculation	**$ 5 00**
Hospital Fees	**10 00**
Lecture Fees	**40 00**
Graduation	**25 00**
Lecture Fees to third course students	**25 00**

For the Recitation Term the Lecture Fees are $10, to those who attend the other courses. All others are required to matriculate and take out the Hospital tickets.

All fees payable in advance to the *Secretary*.

Board and Rooms can be obtained at low rates—according to accommodations—from $3 to $5 per week. Announcement and Catalogue, or any further information which may be desired, can be promptly obtained by addressing

LEARTUS CONNOR, M.D., Secretary,
92 CASS STREET, DETROIT.

STARLING MEDICAL COLLEGE,
COLUMBUS, OHIO.

The Thirty-second Session of Starling Medical College will begin October 2, 1878, and continue until March, 1879. It will be preceded by a preliminary course beginning September 4, 1878. Extensive additions have recently been made to the Museum and other teaching facilities of the College.

FACULTY.—F. Carter, M.D., Dean; H. G. Landis, M.D.; J. H. Pooley, M.D.; S. Loving, M.D.; J. M. Wheaton, M.D.; E. B. Fullerton, M.D.; W. J. Conklin, M.D. (of Dayton); Alex. Dunlap, M.D.; Otto Frankenberg, M.D.

Lecture tickets, including matriculation, $45.

College, cor. of State and Sixth Sts.; Dean's Office, 181 E. State St.

Letters of Inquiry should be addressed to the Dean.

FRANCIS CARTER, M.D., Dean, Columbus, Ohio.

CLEVELAND MEDICAL COLLEGE,
Cor. St. Clair and Erie Sts. Founded 1843.

FACULTY:—J. L. Cassels, M.D., LL.D.; Proctor Thayer, M.D.; H. K. Cushing, M.D.; John Bennitt, M.D., Dean; Jacob Laisy, M.D.; John B. Darby, M.D.; E. W. Morley, M.D.; Isaac N. Himes, M.D.; X. C. Scott, M.D.; B. W. Holliday, M.D.; Lewis Buffett, M.D.; H. H. Powell, M.D.; Jno. F. Isom, M.D.; W. W. Holliday, M.D.

FEES.—Lecture Tickets, including Matriculation Ticket, $50.00.

WINTER SESSION.—Commences on the third Wednesday in September, and continues 24 weeks.

SUMMER SESSION.—Commences on the first Monday in April.

H. H. POWELL, M.D., Secretary, 323 Euclid Avenue.

UNIVERSITY OF MICHIGAN.
DEPARTMENT OF MEDICINE AND SURGERY.

The 29th annual course of lectures will commence on Oct. 1, 1878, and continue *nine months*.

Course separate but equal for women.

Matriculation Fee, *paid but once*—Residents of Michigan, $10; non-residents, $25.

Annual Dues—Residents of Michigan, $30; non-residents, $35.

Graduation Fee—For all alike, $10.

Send for Circular and Catalogue.

A. B. PALMER, M.D., DEAN, Ann Arbor, Mich.

IOWA STATE UNIVERSITY,
IOWA CITY, IOWA.

MEDICAL DEPARTMENT.—SESSION OF 1878-'79.

The next term will commence on Wednesday, October 9th, and continue until the first Wednesday in March, 1879. No preliminary course. Six lectures daily, including clinics at Mercy Hospital, to which there is free admission. Advanced students will be entrusted with the care of cases. Candidates will be required to perform operations upon the Cadaver. Dissecting and clinical material abundant. Requirements of the Am. Ass. of Med. Colleges strictly complied with.

FEES.—For the entire Course, $20.00. Matriculation Ticket, $5.00. Demonstrator's Ticket, $5.00. Examination Fee, $25.00. For circular or further information, address

W. F. PECK, M.D., Dean, Davenport, Iowa; or,
E. F. CLAPP, M.D., Sec'y, Iowa City, Iowa.

N. H. MEDICAL INSTITUTION AT
DARTMOUTH COLLEGE.

The *Eighty-second* Annual Course of Lectures begins Aug. 1, 1879, and continues fourteen weeks. Recitations from Dec. 5 to June 20.

FACULTY:—E. R. Phelps, M.D., LL.D., Practice Emeritus; O. P. Hubbard, M.D., LL.D., Chemistry; J. Ordronaux, M.D., LL.D., Medical Jurisprudence; C. P. Frost, M.D., Practice; P. S. Conner, M.D., Surgery; E. S. Dunster, M.D., Gynecology and Obstetrics; H. M. Field, M.D., Therapeutics; L. B. How, M.D., Anatomy and Physiology.

FEES:—Matriculation, $5; Lectures, $77; Graduation, $25; Recitations, $40.

For Circular, address C. P. FROST, M.D., Dean, Hanover, N. H.

MEDICAL DEPARTMENT OF
HARVARD UNIVERSITY,
BOSTON, MASS.

NINETY-FIFTH ANNUAL ANNOUNCEMENT. (1878-79.)

Instruction is given by Lectures, Recitations, Clinical Teaching, and Practical Exercises throughout the Academic year. The year begins Sept. 26th, 1878, and ends the last Wednesday in June, 1879. Persons who hold no degree in arts or science must pass an *examination for admission* to this School in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held in June both at Boston and at Cincinnati, in September at Boston only. Examination for advanced standing Sept. 23d.

A Catalogue, containing detailed information and specimens of examination papers, will be sent on addressing

DR. R. H. FITZ, Secretary, 108 Boylston St., Boston, Mass.

MEDICAL INSTITUTION OF
YALE COLLEGE.

Spring Term begins February 14, and closes June 26, 1878.

Winter Term begins October 3, 1878; closes January 30, 1879.

FEES.—Matriculation Fee, $5.00. For the Spring Term, $60.00. Contingent Expenses of Laboratory, Spring Term, $10.00. Winter Term, Lecture Fees, $105. Demonstrator's Ticket, paid once a year by those who dissect, $5.00. Graduation Fee, $25.00.

For further information, address

CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.
(Medical Department of the Northwestern University.)

The Winter Session will commence on the first day of October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $50.00. Graduation Fee, $30.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $6.00.

All Fees are payable in advance to the Registrar, Prof. HOLLISTER.

Any further information that may be desired can be promptly obtained by addressing

J. H. HOLLISTER, M.D., Secretary and Registrar of the Faculty,
No. 73 Randolph Street, Chicago, Ill.

COLLEGE OF MEDICINE
(Medical Dept. Syracuse University),
SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar,

WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE,
337 and 339 S. Lincoln St., Chicago.

The *Ninth Annual Course of Lectures* will commence on Tuesday, October 2, 1878, and continue twenty-one weeks. College building new. Clinical and dissecting advantages unsurpassed.

FACULTY.—Wm. H. Byford, A.M., M.D., Pres., Obstetrics; T. D. Fitch, M.D., Sec'y, Gynecology; Chas. W. Earle, M.D., Treas., Diseases of Children; I. N. Danforth, M.D., Pathology; J. R. Owens, M.D., Surgery; Wm. E. Quine, M.D., Practice of Medicine; D. R. Brower, M.D., Therapeutics and Nervous Diseases; Sarah H. Stevenson, M.D., Cor. Sec'y, Physiology; D. W. Graham, A.M., M.D., Anatomy; Plym. S. Haves, M.D., Chemistry.

For information or announcement, address either of the Secretaries, at 125 State St. W. H. BYFORD, A.M., M.D., Pres.

Official Announcements of the Medical Colleges of the U. S.

The Fourteenth Annual Course of Lectures in the

Medical Department of the University of Wooster,

LOCATED AT CLEVELAND, OHIO,

Will begin Wednesday, October 3d, 1878, and continue until the last Wednesday in February, 1879. Medical and Surgical Clinics, Monday and Tuesday, Thursday and Friday of each Week, at Charity Hospital. The Preliminary Term commences Sept. 19. The Summer Course of Recitations and Clinics begins April 2, 1878, and continues 12 weeks.

FACULTY:—G. C. B. WEBBER, M.D., Dean; L. FIRESTONE, M.D., LL.D.; W. J. SCOTT, M.D.; H. J. HERRICK, M.D.; CONWAY NOBLE, Esq.; A. C. MILLER, M.D.; JOEL POMERENE, M.D.; D. B. SMITH, M.D.; H. W. LONG ISLAND COLLEGE HOSPITAL, BROOKLYN, N. Y.

Annual Announcement and Circular, 1877-78.

The READING AND RECITATION TERM will commence October 4, 1877, and close February 14, 1878.
The REGULAR TERM will open March 5, 1878, and close the last week in June following.

FACULTY OF THE COLLEGE.

SAMUEL G. ARMOR, M.D., LL.D., Professor of the Practice of Medicine, and Dean.
GEORGE W. PLYMPTON, A.M., Professor of Chemistry.
JOSEPH H. RAYMOND, M.D., Professor of Physiology.
DANIEL AYRES, M.D., LL.D., Emeritus Professor of Surgery.
ALEXANDER J. C. SKENE, M.D., Professor Diseases of Women and Children.
EDWARD SEAMAN BUNKER, M.D., Professor of Obstetrics.
CORYDON L. FORD, M.D., Professor of Anatomy.
JARVIS S. WIGHT, M.D., Professor of Surgery, and Registrar.
JOHN D. RUSHMORE, M.D., Professor of Materia Medica.

THE CLINICAL ADVANTAGES OF THE LONG ISLAND COLLEGE HOSPITAL ARE UNSURPASSED IN THIS COUNTRY.
For circulars, address DEAN or REGISTRAR

University of Pennsylvania, Medical Department.

113th ANNUAL SESSION, 1878—79.

The Higher plan of Medical Education is now enforced, requiring attendance upon three graded courses of five months each. Didactic instruction is increased. Bedside instruction of each student in Physical Diagnosis, Clinical Medicine and Surgery, and Gynæcology is provided. The clinical and laboratory facilities are unrivalled in America. Pharmacy, Analytical and Medical Chemistry, Histology, Normal and Morbid Anatomy, and Operative Surgery are taught practically.

A Dental Department has recently been instituted.

For particulars, see ANNOUNCEMENT, for which address

JAMES TYSON, M.D., *Secretary,*

MEDICAL BOOKS

When you want any Medical Books, or any information concerning them, write to

WM. WOOD & CO., Publishers and Dealers in Medical Books,
27 Great Jones Street, New York.

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*
Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Cars.*
Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.,** or to the Company's office, **205-213 E. 12th St., New York,** will receive prompt attention.

FOOD for INFANTS and INVALIDS

ANTILLANA.

An unmixed product from a tropical species of Canna. A light and nourishing food for Children and Invalids. Particularly adapted to Infants artificially fed, to dyspeptics and persons of weak digestion.

Pleasant to the eye and agreeable to the taste. For nursing mothers with a deficiency of milk, a bowlful taken before retiring at night will so effectually increase the secretion of milk as to save from the exhaustion consequent on the child's night nursing.

DIRECTIONS FOR USE.—As a plain food for Children and for Nursing Mothers, take a teaspoonful of the Antillana, mix into a paste with cold water, then pour over it a cupful of boiling water or boiling milk (or half milk and half water), allow it to boil for a few seconds only, and sweeten to taste. This will produce a cupful of thick, nourishing and palatable food. *See wrappers for further directions.*

Proprietor, JAMES ELMSLIE, 137 Duane Street, New York City.

PRIZE MEDAL, PARIS MARITIME EXHIBITION, 1875.

NEAVE'S FOOD

FOR

INFANTS

AND

INVALIDS,

Is pre-eminently rich in albumenoids and phosphates, and the starch which it contains is in a state readily assimilated by the infantile digestion.

NEAVE'S FOOD has received the high and unqualified approval of eminent medical men for many years past. It usually commands a ready sale, both in Great Britain and in the States, for it is strongly recommended by mothers to the notice of their lady friends; and infants often give it a preference, refusing other foods. As a natural result, the sale has extended rapidly, especially during the past four years, necessitating the erection of extensive premises, again enlarged in December, 1876, where the preparation is carried on under the personal supervision of Mr. Neave.

NEAVE'S FOOD is sent in large quantities to the Colonies and to the United States. It is prepared with special reference to exportation.

NEAVE'S FOOD is sold in tins and tinfoil packets by chemists and storekeepers at home and abroad.

For terms, apply to any wholesale or export house, or to manufacturers,

JOSIAH R. NEAVE & CO., Fordingbridge, England.

☞ Doctors and Medical Practitioners wishing to try Neave's Food are requested to apply for a Sample Packet (gratis) at the undermentioned Agency.

AGENT FOR THE STATES,

J. O. NOXON, 444 Fulton Street, Brooklyn, N. Y.

Medal of Excellence Awarded at the American Institute Fair, 1877.

SHEDDEN'S FOODS FOR THE DIABETIC AND DYSPEPTIC.

The prepared Flour of Bran, freed from Starch by Camplin's process, in 10 lb. cases, $5.00. Gluten Flour, rich in nitrogenous matter and the phosphates, in 10 lb. cases, at $3.00.

SHEDDEN & CO., Broadway, cor. 34th St., New York.

HORLICK'S FOOD FOR INFANTS.

This article, as shown by analysis, is the only true substitute for Mother's Milk, and, unlike the other foods, **does not contain starch.** Infants cannot digest **starchy foods** until they have their teeth. This preparation also contains the **Phosphates** so essential for the production of bone and brain. It will **sustain life single-handed.** Requires no cooking.

We also Manufacture

HORLICK'S FOOD FOR DYSPEPTICS.

HORLICK'S FOOD FOR CONSUMPTIVES.

Price $1.00 per bottle. Trial size, 50 cents.

J. & W. HORLICK & CO., Chicago, Ills.

SUPERIOR NUTRITION THE LIFE.

IMPERIAL GRANUM.

THE INVENTION OF AN EMINENT FRENCH CHEMIST.

To Physicians and the Public:

This preparation is, in composition, as advertised, principally the Gluten derived, by chemical process, from *very superior growths of wheat*, and should not be confounded with burnt or boiled Flour, in which the Gluten or sanative qualities are destroyed or made medicinally inert, nor with Crushed Wheat, or finely ground Wheaten Grits, styled "Medicinal Food," and sold under various names, in which the starch and impurities contained in wheat are retained in larger quantity.

By Dubisson's formula, the starch, impurities and soluble matter found in the Wheat Cereal are effectually excluded; the Gluten only retained, which is condensed, granulated and prepared to keep in all climates, and justly entitled

IMPERIAL GRANUM.

It is well known, and should be fairly considered, that nothing of merit can b *favorably received and commended by the public without being followed by* imitations of a questionable character. IMPERIAL GRANUM *is not the exception, for no* preparation *has* attracted more attention *nor been more fiercely imitated, by competition*, even to wording and shipping order.

Whilst again it can be truly said that no preparation ever offered for sale has been more carefully prepared and thoroughly tested, nor has met with a more welcome reception and universal approval, or afforded more relief to invalids or to young and suffering children and aged persons. This has been confirmed by thousands of testimonials from Chemists, Physicians, Heads of Families and the Press.

Respectfully,

E. HEATON,

General Agent for the United States.

SOLD BY DRUGGISTS, AND PHARMACISTS, IN THE *PRINCIPAL CITIES OF THE UNITED STATES.*

JOHN CARLE & SONS, NEW YORK.

Dr. N. Gerber's Milk-Food

Prepared in THUN, SWITZERLAND.

Many farinaceous foods prepared for children contain too much sugar and starch, while the milk added to these foods is insufficient in quantity, so that the proportion between the azote and non-azote bodies is not fairly balanced, and consequently, the children are fed in an irrational manner.

After long experimentation, in which I have sought to avoid this serious defect, I now offer an article which I believe will meet the necessity of the case, inasmuch as it contains **less starch and sugar and more milk.**

DIRECTIONS.

For children up to three months old, one part of the "Food" to eight or ten parts **cold water.** The quantity of water may be reduced for older children to four or five parts to one of "Food." After mixing well, boil it five minutes, taking care to stir it well.

CHEMICAL ANALYSES.

The composition of Dr. N. GERBER'S "Milk-Food" is stated by well-known Chemists, as follows:

THE ANALYTICAL SANITARY INSTITUTION, LONDON, April 27, 1876.

The results of my analysis show that Dr. GERBER'S Milk-Food is composed in part of condensed milk; that it contains all the elements of a complete food, namely: the Starchy, Saccharine, Albuminous, and Mineral, in such proportions as render the food well adapted for the nutrition of infants and young children.

The amount of Nitrogenous matter and of Phosphoric Acid furnished are considerable.

The Nitrogenous matter includes 1.88 per cent of Nitrogen, and the Mineral matter 0.51 per cent of Phosphoric Acid.

ARTHUR HILL HASSALL, M.D., Chemist,
Author of "Food; its Adulterations, and the Method for their Detection."

MONTREAL, Canada, November 10, 1877.

I have satisfied myself that Dr. GERBER'S Milk-Food is not a mere "Farinaceous Food," but that it really contains, as it professes to contain, the formative elements of *Flesh, Blood and Bone*; also *Carbonaceous Matter* for the maintenance of animal heat,—thus constituting a *complete diet*, formed on the basis and type of Human Milk. * * * I can conceive of no better substitute for "Mother's Milk."

J. BAKER EDWARDS, Ph.D., D.C.L.,
Professor of Chemistry Bishop's College and College of Pharmacy, Montreal, and Public Analyst for District of Montreal, under Inland Revenue Act.

HYGIENIC PHYSIOLOGICAL INSTITUTE, MUNICH, Sommer, 1877.

Repeated experiments of Dr. GERBER'S Milk-Food, made by D. Med. FR. RENK, Assistant of Privy Counsellor Prof. Dr. MAX VON PETTENKOFER, at his Laboratory; also, at Prof. Dr. C. VOIT'S Physiological Institute in Munich, show the average analysis to be:

Water,	4.31 per cent.
Mineral Salts,	2.03 "
Fats,	5.28 "
Albuminates,	15.51 "
Hydro-Carbons, soluble,	48.41 "
" " insoluble,	24.46 "
	99.96 "

This preparation is highly recommended by:

Prof. DEMME, Physician to the Jenner Hospital for Children Berne, Switzerland.

Dr. J. RUD. SCHNEIDER, Sup't of the Hospital of the Canton Berne, Switzerland.

A. M. SIGEL, M.D., Phys. to the Olgo Hospital Asy. for Infants, Stuttgart.

Dr. PIO MORI, Medico Primario, Phy. to Hospital for Children, Rome, Italy.

Dr. GRIFFINI, Director of the Foundlings' Home and Lying-in Hospital in Milan.

E. BOUCHUT, Professor of the Faculty of Medicine of Paris, and Phys. to the Sick Children's Hospital.

Prof. Dr. ZWEIFEL, in Erlangen.

Send for Circular with full particulars and valuable testimonials from prominent American physicians.

ROETHLISBERGER & GERBER,

NEW YORK.

BUFFALO LITHIA WATERS

FOR

Stone, Gravel, Diabetes, Hæmaturia

AND

Diseases generally of the Urinary and Genital Organs.

Stone in the Bladder and Hemorrhage from the Bladder.

Case of Mrs. ——, of Charlotte, N. C., stated by Dr. J. B. JONES, *of this place:*

"Mrs. —— suffered with stone in the bladder, composed of alternate, concentric layers of calcarious matter and lithic acid, attended with occasional alarming hemorrhage from the bladder. I prescribed for her the Buffalo Lithia Water, the continuous use of which arrested the formation of stone, and the hemorrhage occurs now at much longer intervals."

Dr. HUNTER McGUIRE, *Professor of Surgery in the Richmond, Va., Medical College:*

"I prescribe the Buffalo Lithia Water freely in my practice, and have found it invaluable as an alkaline diuretic."

Dr. HARVEY L. BYRD, *of Baltimore, late Professor of Diseases of Women and Children in the College of Physicians and Surgeons of Maryland:*

"In all inflammatory conditions of the Kidneys and Bladder, the Buffalo Lithia Waters may be regarded as well nigh specific. I have witnessed remarkable results from them in Hæmaturia and Gravel—in some cases of the latter affection which had resisted the best medical treatment and the most celebrated mineral waters of the country."

Dr. THOS P. ATKINSON, *of Danville, Va., at one time President of the State Medical Society:*

"In Gravel, Diabetes, Hæmaturia, Inflammation and Ulceration of the Bladder, and diseases generally of the Urinary Organs, the Buffalo Lithia Waters may be regarded as one of the most potent of known remedies. I have witnessed astonishing results from them in cases coming under this classification."

Dr. HENRY M. WILSON, *of Baltimore:*

(The "*experience*" to which Dr. W. refers as of "*such a positive character*," was the relief of an *aggravated* and *obstinate* case of *gravel*.—PROPRIETOR.)

"My experience in the use of the "Buffalo Lithia Springs Water" has not been large, *but it is of such a positive character*, that I do not hesitate to express my preference for it, as a diuretic, over all other waters I have ever used."

Dr. JOHN C. COLEMAN, *a retired Surgeon of the U. S. Navy, Scottsburg, Va.:*

"One of the most unmanageable and distressing cases of Gravel that ever came under my observation, after long resisting all medical treatment, was entirely relieved by the use of the Buffalo Lithia Waters for six weeks."

Dr. G. F. ADAMS, *of Baltimore:*

"The combined strength of half a dozen of the best diuretics in our Pharmacopœia will not produce as much urinary discharge in either Ascites, Hydrothorax or general Dropsy."

Dr. E. M. CAMPBELL, *of Abingdon, Va., a well-known member of the State Medical Society:*

"I prescribed the Buffalo Lithia Springs Water for the most aggravated case of Hæmaturia that I have ever seen. A few bottles of the water produced a complete cure."

Dr. T. B. GREER, *of Rocky Mount, Franklin Co., Va.:*

"I have recently had occasion to try the 'Lithia Water' in a case of *Inflammation* and *Ulceration* of the bladder, caused by the retention of urine, the result of stricture of twenty years' standing. I had exhausted all of the resources, both of experience and authority, without relief, and when my patient commenced the use of it, had no hope of his recovery. He has been using the water five weeks, with results so favorable that he now has every prospect of complete recovery; and without some unexpected change in his condition, will be on his feet in a short time. The effects of the water in this case have been marvelous. For the sake of humanity I shall keep a record of the case, and report to you as it advances."

In a subsequent communication, Dr. GREER, referring to the above case, says:

"In the case of 'Inflammation and Ulceration of the Bladder," heretofore reported, the patient recovered, and I attribute the recovery entirely to the Lithia Water."

Dr. SILAS H. HARRIS, *of Clarksville, Va.:*

"The powers of this water are conspicuously displayed in removing those diseases of the male sex acquired by licentiousness and debauchery. Penetrating as it does every organ and every tissue of the human body, through the medium of the circulation, chronic disease of the kind referred to, and the scattered debris of old complaints, are hunted up and rooted out. The canker-worm of constitutional disease, which has been so long gnawing into his very vitals, impairing his manly energies, is made to loosen its poisonous fangs, and allow nature, unobstructed, to perform her work of reparation."

Dr. M. H. HOUSTON, *Physician to Randolph Macon College, Ashland Va.:*

"A gentleman far advanced in years labored under an irritation and inflammation of the neck of the bladder, so extreme as to render it necessary for him to make efforts to relieve it from twelve to twenty times during the night. Under the use of the water the relief was so complete as to render it necessary for him to rise only once, and often not at all during the night. As far as known, the relief thus afforded has been permanent."

These Waters, in cases of six gallons, may be had *at the Springs*, at $5 per case; or Caswell & Massey, cor. Broadway and 25th St.; Hegeman & Co., No. 203 Broadway, New York, at $6.50 per case. The Springs now open for visitors. Springs Pamphlet send to any address.

THOS. F. GOODE, Proprietor,
Buffalo Lithia Springs, Va.

TAMAR INDIEN

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same does always produce the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris.

To be had of all Respectable Chemists throughout the world.

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution**, which is **generally preferred**; or of an **elixir**, when a slight stimulant is desired.

DUCRO'S ALIMENTARY ELIXIR

A Combination uniting the properties of ALCOHOL and RAW MEAT. It has been Mr. Ducro's aim in preparing this elixir to present, under the form of a pleasant cordial, the nutritive and restoring properties of raw meat and the stimulating properties of alcohol. In this he has been eminently successful, judging from the great number of physicians who prescribe and use this food medicine. This preparation, which has been used with great success in the hospitals of Paris since 1868, is adapted to the treatment of all diseases requiring the administration, in a small volume, of a tonic able to stimulate and support the vital forces, as in *Pulmonary Phthisis, Depression and Nervous Debility, Adynamia, Malarial Cachexia*, etc. It is especially adapted for delicate ladies and children, debilitated old people and convalescents.

Paris: Place de Vosges, 20.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

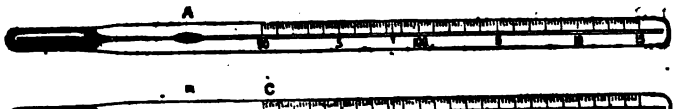
Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

Pharmacien, No. 40 Rue Bonaparte, Paris, without which none are genuine.

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING

CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertence in use, or rough usage in traveling, can possibly disarrange it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... $6 00

We also offer:

No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... 3 50

Sent free by mail on receipt of price. Manufactured by L. CASELLA, London.

LEITER'S HYPODERMIC SYRINGE

MANUFACTURED AND PATENTED BY

F. G. OTTO & SONS,

Manufacturers and Importers of Surgical Instruments, Druggists' Sundries, &c.,

64 Chatham Street, New York.

The construction of this Syringe is as simple as it is novel. It consists of a glass cylinder, which is ground conic on the inside of each end; into these sockets fit two hard rubber cones *a* and *b*, Fig. 1. To facilitate the holding of the syringe the glass is ground in the manner shown at *C* and *D* in Fig. 1. The upper hard rubber fitting *a* is for the reception of the needle which is provided with a cone as shown at *D* in Fig. 2, the lower fitting *B*, Fig. 1, receives the piston-rod, which is also made of hard rubber. The glass cylinder being ground conic (making the opening larger at the extreme ends) makes the introduction of the piston very easy, after being taken apart for cleaning or lubricating. Having made considerable improvements in the manner of filling the syringe, as well as in the needles, we feel justified in saying that this syringe is far superior to any yet brought before the profession. The syringe is filled in a very simple manner.

Fig. 3 shows the vial. *B* in Fig. 3 is a cone which fits the socket in fitting *a*, Fig. 1, after having introduced cone *B*, Fig. 3, into fitting *A*, Fig. 1, unscrew the fitting *C* in Fig. 3, draw down the piston and the syringe will fill readily and without a chance for air coming into the same. *A* in Fig. 3 is a cap to close the vial.

To fill the vial unscrew the fitting *C*, Fig. 3, entirely.

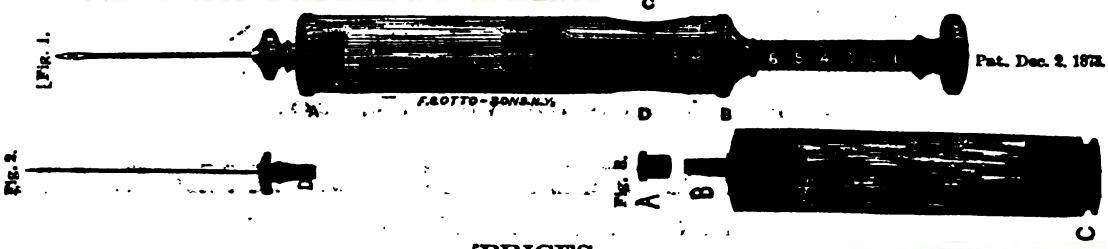
The Advantages of this Syringe are:

1st—It has no metal to corrode, the only metal present being on the needle which, if wire is introduced after using, is easily kept open.

2d—The easy manner in which the Syringe may be taken apart for cleaning and lubricating.

3d—The manner of filling the Syringe.

The Syringe before described has been adopted by the ***Medical Department of the United States Army.***



PRICES.

DR. McINTOSH'S

NATURAL UTERINE SUPPORTER.

No instrument has ever been placed before the medical profession which has given such universal satisfaction. The combination is such that the Physician is able to meet every indication of Uterine Displacements. Falling Womb, Anteversion, Retroversion and Flexions are overcome by this instrument, where others fail; this is proven by the fact that since its introduction to the Profession it has come into more general use than all other instruments combined.

Among the many reasons which recommend this Supporter to the Physician is its self-adjusting qualities. The Physician after applying it need have no fear that he will be called in haste to remove or readjust it, as is often the case with rings and various pessaries held in position by pressure against the vaginal wall, as the patient can remove it at will and replace it without assistance.

The Abdominal Supporter is a broad morocco leather belt with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen. The Uterine Support is a cup and stem made of highly polished hard rubber, very light and durable, shaped to fit the neck of the womb, with openings for the secretions to pass out; as shown by the cuts. Cups are made with extended lips to correct flexions and versions of the womb.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, pass down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic adapt themselves to all the varying positions of the body and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Antiversion, Retroversion, or any Flexions of the womb, and is used by the leading physicians with never-failing success even in the most difficult cases.

Price—To Physicians, $8.00; to Patients, $12.00.

Instruments sent by mail, at our risk, on receipt of price, with 16 cents added for postage, or by Express, C.O.D.

WM. WOOD & CO., Publishers, 27 Great Jones St., N.Y.

NOTICE.

It will please many of our readers to know that the firm of Hegeman & Co., whose failure we noticed in January, have again resumed their business. Mr. Geo. B. Marcher, who for twenty years had charge of the wholesale and manufacturing business of the establishment, has been associated with the concern, and the business will again be carried on as before, at 203 Broadway.

Editorial "New Remedies," April Number.

HEGEMAN'S

STANDARD

PREPARATIONS.

CORDIAL ELIXIR OF CALISAYA BARK, a pleasant and agreeable Tonic for dyspepsia, etc.; for persons living in Fever and Ague districts, it will be found invaluable as a preventive.

FERRATED ELIXIR OF BARK, the most perfect Iron Tonic; a pleasant cordial, containing the active principles of Calisaya Bark and Iron.

TOLU AND LIVERWORT EXPECTORANT, a speedy and certain cure for coughs, hoarseness, and all diseases of the throat and lungs.

GENUINE MEDICINAL COD LIVER OIL, for Consumption, Scrofula, Rheumatism, etc. Our Oil has stood the test of twenty years, and thousands of patients attribute their recovery to its use. It is warranted pure.

NUTRITIVE TONIC.

BEEF, WINE AND IRON.—Our *Nutritive Tonic* is prepared from Extract of Beef, Pure Sherry Wine, and Citrate of Iron, combined with a pleasant form; and, in all cases where an efficacious Tonic is desired, it will be found a most valuable preparation. It is extensively used in all sections, and highly recommended by the most eminent physicians.

HEGEMAN'S

COD LIVER OIL AND LIME.

The name of this Compound of Medicine is undoubtedly well known to very many; in fact, the combination of the Genuine NEWFOUNDLAND Cod Liver Oil and Phosphate of Lime, as prepared by us, has a world-wide reputation as the most potent remedial agent in the treatment of that scourge of our country—Consumption—and more prevalent in our climate than any other section in the world.

We have spared neither pains nor expense in the manufacture of this preparation, and its superior quality is shown in the fact that wherever it has been introduced it has superseded all others.

CHAPPED HANDS AND FACE,

Sore Lips, Dryness of the Skin, &c., &c.,

Cured at once by HEGEMAN'S CAMPHOR ICE WITH GLYCERINE. It keeps the hands soft in all weather. See that you get HEGEMAN'S Sold by all Druggists. Price 25 cents; sent by mail for 30 cents.

WHAT IS THE CELLULOID TRUSS?

It is composed of a steel spring, finely tempered and covered or encased with this compound, forced on under immense pressure without any seam, and quite as smooth as the finest polished Ivory. This material being entirely impervious to moisture or perspiration, the spring is completely protected and preserved from rust, thus rendering it perfectly indestructible.

The Pad is made of the same material and in different forms, and being hollow and perfectly smooth, renders it light, comfortable, and pleasant to the person. Unlike Hard Rubber, this coating is not liable to crack in cold weather, and needs no heating to fit it to the body, neither does it emit any sulphurous or unpleasant odor.

It does not chafe; will not break or rust; can be used in bathing; is cool and comfortable, always clean and good as new. Every Celluloid Truss is warranted.

We unhesitatingly pronounce the "Celluloid Truss" to be the most perfect instrument for the relief and cure of Hernia ever produced. Those afflicted should, without fail, examine this Truss before purchasing any other.

SOLD BY ALL LEADING DRUGGISTS AND DEALERS.

SOLE MANUFACTURERS OF THE CELLULOID TRUSS

(EXTRACT FROM JUDGES AWARD.)

The United States Centennial Commission has examined the report of Judges, and accepted the following reasons and decreed an award in conformity therewith:—

CELLULOID TRUSS.

Beyond comparison the Most Perfect Truss exhibited For general excellency of material as a coating for Steel Springs, resisting perspiration, for beauty of finish, perfect workmanship and adaptability for all the purposes desired in this class of instruments.

JUDGES.—C. B. WHITE, M. D., United States; J. H. THOMPSON, A. M., M. D., United States; ERNEST VON FLEISCHEL, M. D., Vienna; WM. ROTH, M. D., Surgeon-General German Army.

☞ *Please mention THE MEDICAL RECORD.*

McKESSON & ROBBINS' GRANULES, Gelatine-Coated.

Aconitia	1-60 gr.	**Mercury, Proto-Iodide**	1-5, 1-4, 1-2 gr.
Arsenious Acid	1-50, 1-40, 1-30, 1-20 gr.	**Morphia, Acetate**	1-8, 1-4 gr.
Atropia	1-60 gr.	**Morphia, Sulphate**	1-16, 1-10, 1-8, 1-6, 1-4 gr.
Belladonna Extract	1-4 gr.	**Morphia, Valerianate**	1-8 gr.
Calcium, Sulphide	1-10 gr.	**Podophyllin**	1-8, 1-4 gr.
Codeia	1-16, 1-5 gr.	**Quinia**	1-2, 1-4 gr.
Corrosive Sublimate	1-40, 1-30, 1-20 gr.	**Strychnia**	1-60, 1-40, 1-30 gr.
Digitalia	1-60 gr.	**Sulphur, Iodide**	1-25, 1-10 gr.
This is prepared in our own laboratory and can be confidently relied upon.		**Tartar Emetic**	1-100, 1-20, 1-4 gr.
Mercury, Bin-Iodide	1-25, 1-16 gr.	**Zinc, Phosphide**	1-6, 1-4, 1-2 gr.

Physicians have experienced the need of a reliable and pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons; and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our granules have been appreciated and are being extensively used by the profession.

Be careful and see that "McKesson & Robbins" is on the label, and specify McK. & R. on prescriptions.

Full lists furnished upon application to

McKESSON & ROBBINS, 91 Fulton Street, New York.

Quote MEDICAL RECORD.

BEDFORD (VA.) SPRINGS WATER & MASS.

Standard Natural Remedies endorsed by Medical profession for Throat, Skin, Stomach, Blood and Uterine Diseases. Efficiency attested by results in thousands of cases during the last 25 years. Full proof, with analysis and directions, sent with each package. Prices: Water, $4.00 case; Mass, $1.00 package, or $10.00 a dozen. Liberal terms to the trade. Special rates to physicians. "Successfully used for Dyspepsia, Diarrhœa and Female Complaints."—Prof. Sam'l Jackson, M.D., Univ. of Penn. "Invaluable for Neuralgia and Nervous Diseases."—Geo. T. Harrison, M.D., Woman's Hospital, N. Y. "Unequaled for diseases peculiar to females."—John P. Metteser, M.D., LL.D., of Va. "Specific for Scrofulous and Cutaneous Affections."—J. M. Allen, M.D., of N. C. "Excellent Tonic Alterative and Diuretic—one of Nature's greatest remedies."—Medical Asso. of Va., Lynchburg. Address, **A. M. DAVIES, Prest. of the B. A. & I. S. Co., Lynchburg, Va.**

Sold by CASWELL & MASSEY, New York City.

GARNIER, LAMOUREUX & CIE.,

213 RUE ST. HONORÉ, PARIS,

Beg leave to inform the profession that Mr. F. ALFRED REICHARDT, 404 Fourth Avenue, N. Y., is their Sole Agent, and keeps a full stock of their Sugar-Coated Pills and other goods on hand.

Referring to above, I beg leave to call the attention of the profession to the goods made by Messrs G., L. & Co., of Paris. They are the first house which made Sugar-Coated Pills a specialty, and their goods were introduced twenty-five years ago into the United States. Their goods are superior in finish and quality to any other made. They use no coating between pill mass and sugar, and all their pill masses are easily soluble. **Their list prices to physicians are lower than other makers,** and their goods more reliable.

The latest additions to their list are: Dragees of Crystal; Valerianate of Ammonia, without taste or smell, 2 grains; Citrate of Codeine, ¼ grain; Monobromide of Camphor, 2½ grains; Codeia, 1-5 grain; Crotons Chloral (Lietreich's), 2½ grains; Cynoglosse or Pil. Nepenthe; Diascordium; Extract Eucalyptus, 2½ grains; Malate or Pomate of Iron; do., with ¼ grain Extr. Nux Vomica; Extr. Gliscinum; Drag-Meglin; Quin. and Ferri Citras, (20% Quina.) 2 grains; Tonic Aperient; also the already well-known Granil Proto-Iodide Mercury, 1-5 grain, and Dr. Francis' Triplex Pills.

Goods sent free by mail on receipt of list price. Please send for Price List and Descriptive Pamphlet, mailed free on application.

F. ALFRED REICHARDT, Pharmacist and Importer, 404 Fourth Avenue.

ALOIN, { THE ACTIVE PRINCIPLE OF ALOES.

MANUFACTURED BY THE DISCOVERERS,

T. & H. SMITH & CO., Edinburgh and London.

"The uniformity in strength of Aloin, the smallness of its dose, and the certainty of its action should commend it to the favourable consideration of all medical practitioners."—*Vide* Dr. WM. CRAIG'S Investigations, published in *Edinburgh Medical Journal* for May, 1875.

Messrs. SMITH will send free by post a Sample of Aloin to any Medical Gentleman desiring it.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, June 29, 1878.

THE MONOPOLY OF PAPERS BY THE AMERICAN MEDICAL ASSOCIATION.

It would hardly be believed, even by the most credulous, that the American Medical Association has seen fit, in an authoritative way, to hinder the publication in medical journals of papers read at the meeting until such papers shall have appeared in the *Transactions*. This, however, is the fact, as will be seen by a reference to a proceeding at one of the meetings of the Sections. On the occasion alluded to it was moved that a paper which attracted a good deal of attention and treated of a subject in which every practitioner was more or less interested, should be published without delay in the medical journals. Naturally such a reasonable request would have been granted without debate; but when it was stated that such a course would spoil the sale of the *Transactions*, and was therefore contrary to the By-laws, there was apparently an end to all argument upon the question. The author of the paper not caring to go contrary to the wishes of the Association, abides by the decision, declines to have the article published, and the profession, or at least that small part of it which reads the *Transactions*, is compelled to wait for the information which it contains for many months. And yet we are told in the Code that it is wrong to wilfully withhold anything good from the profession, and that all personal considerations are secondary to the mitigation of human suffering and the prolongation of human life. It is also considered improper to claim proprietorship in anything calculated for the benefit of the sick, or to hinder, in any way, directly or indirectly, the widest and promptest dissemination of any knowledge which may tend to alleviate the sufferings of humanity. On the other hand, it is perhaps necessary, in view of the necessity of making the *Transactions* a success, to strain every point in its favor by forcing the members to subscribe.

But what becomes of the papers which are monopolized by the Association? Buried is a mild expression for the oblivion to which they are usually consigned. We do not mean to say that no one reads them, for this would obviously be an exaggeration. Besides the proof-reader, who is paid for it, the author himself very rarely fails to peruse his paper from beginning to end, and also possibly one out of a hundred to whom he sends his complimentary reprints. For the papers of real value in the *Transactions* there are comparatively few readers, because, aside from a very small edition, any interest which might have developed itself at the time the papers were read has passed away. Although this is one of the inevitable results of the publication of papers in volumes of Transactions, there is no reason why the Association should use its authority in preventing a proper disposal of such papers so that they may be available to the profession. The Association takes upon itself a grave responsibility in deciding the question in favor of the success of the *Transactions* against the real wants of the profession at large. When we look at this question from an author's point of view, the answer, as to the policy which should be pursued, is quite obvious. He, of course, is desirous of the widest publicity and quickest dissemination of his views. If, however, he loses this right for the mere honor of reading his paper before one or two hundred persons present at a meeting of a Section, and for the mere privilege of entombing his production in an edition of four or five hundred copies, he may not try the experiment as often as the mere success of the volume of *Transactions* may demand. We, however, take such a contrary view from that of the Association in this matter, that we have not hesitated to appropriate in our reports of the Association and of its Sections any and every item which in itself might interest the profession, and shall continue to do so despite any selfish and stupid by-laws to the contrary. The proceedings of the Association belong to the profession, and we see no good reason why their unlimited publication should be directly or indirectly hindered in the way we have shown. The profession has a direct interest in the repeal of the by-law in question.

LEGAL REGULATIONS FOR THE PRACTICE OF MEDICINE.

II.

The Presidents, other officers, and Censors of the State and County Medical Societies are pledged to faithfully carry out all the laws of the State of New York, referring to the practice of medicine, which have been or may be entrusted to them. The first requisite for this is an efficient registration of all medical men and women.

The Health Board is required to make a registration of all competent and honorable physicians, surgeons, and midwives who send in certificates of births and deaths. The Comitiæ Minoræ of the County Medical

Societies are expected to make lists of all honored and honorable, and duly graduated and licensed physicians, who are entitled to membership in their Societies, and the Presidents are required to invite all such eligible persons to join their respective Societies within sixty days. The Censors of the County Medical Societies are ordered to make a list of all unlicensed and unauthorized physicians, and summon them to obtain certificates of qualification to practise medicine, surgery, and midwifery.

The different city and business directories contain comparatively complete lists of all practising physicians and surgeons, and the editors of the *Medical Register* have done much and most faithful work in the way of registration. Hence it would seem unnecessary for the profession to apply to the Legislature for any new powers for registration until those which have already been granted have been faithfully and wisely tested, and carried out as far as practicable. The Censors of the Medical Society of the County of New York have twice notified all practitioners of medicine and surgery in the city and county to produce their credentials, but direct their Presidents to place a list of all those who did not comply with the Law of 1874 in the hands of the District Attorney for prosecution.

As several years have elapsed since the legal notifications were made, it may be desirable to issue new notices, and then proceed to prosecute the delinquents. As several judgments have already been obtained, the law officers are perhaps sufficiently cognizant of the requirements of the law to proceed promptly and effectively. With the aid of the directories, and the registers of the Board of Health, County Society, and Medico-Historical Society, this will be mere clerical work, for which the County Society should make a small appropriation, and order it carried out. To ease the Censors, who have already done much hard and not unfruitful work, the President should be directed to place the names of all who do not comply with the new notification in the hands of the District Attorney for prosecution.

Those who do apply for examination and certificates of qualification may be granted further time, not in any case to exceed ninety days, and then the names of all who fail to give satisfactory evidence of their moral character and medical acquirements should also be placed in the hands of the District Attorney for prosecution.

There are several medical associations which can materially aid the Censors of the Medical Society of the County of New York in their arduous labors. Thus the East River Medical Association can do much to sift out the worthy physicians of their district. The Medico-Chirurgical Society of German Physicians can do much more. The Harlem Medical Association may co-operate, and the North-Western Medical and Surgical Society, the Yorkville Medical Association, the Morrisania Medical Society, and the Scientific Meeting of German Physicians.

A prerequisite for admission in all these Societies should be membership in the County Medical Society. The Academy of Medicine has applied for and obtained representation in the State Medical Society, and hence all its members and officers should also be members of the County Medical Societies. All the medical colleges have obtained representation in the State Medical Society, hence they should advise, and see to it, that all their graduates living in this State, especially in this city and county, should apply for and obtain membership in their County Medical Societies.

Strangely enough, the midwives are enrolled only by the Board of Health. They are not admitted into the *Medical Register*, although nurses and apothecaries are, and the Association for the Advancement of the Medical Education of Women have paid no attention to them, nor have the County Medical Societies, nor the New York Obstetrical Society, nor the Obstetric Section of the Academy of Medicine.

It is high time that some efficient steps should be taken in this matter; but as the subject is beset with some difficulties, the first step should be the formation of a society of well-educated midwives, already licensed by some other State or country. There are many well-educated midwives here, who have already been licensed in Germany, Italy, France, England, Ireland, and Scotland; and many more utterly unworthy persons from all these countries.

The worthy ones should unite, with the advice and assistance of a sufficient number of physicians of foreign birth already members of the County Society, and form a society of licensed, authorized, competent, and honorable midwives, whose credentials should be thoroughly examined, and whose character and ability should be vouched for by the Association for the Advancement of the Medical Education of Women, or the Scientific Meeting of German Physicians, the Medico-Chirurgical Society of German Physicians, or by committees formed of English, Scotch, Irish, French, and Italian physicians, members of the County Medical Society; or by committees from the New York Obstetrical Society, or the Obstetric Section of the Academy of Medicine.

On Jan. 26, 1829, the Medical Society of the City and County of New York drew up a petition, and sent a resolution to the State Medical Society about apothecaries (see below), which led to the establishment of Colleges of Pharmacy in the State, and how much more important is now the regulation of midwives. The resolution read:

Resolved: From the increasing number of vendors of medicines, called apothecaries, in the cities and populous towns in this State, the numerous and even fatal errors which have arisen from the ignorance of very many of them, and the necessity that demands some regulation in this adjunct department of the profession, that the delegate of this Society be in-

structed to use his influence with the State Society for the procural of its active exertion in any measures which in its wisdom may be thought proper to remedy the evils arising from the present unlicensed preparing and dispensing of medical remedies.

Resolved, That the foregoing resolution be adopted as [part of] the instructions of the delegate to the State Medical Society.

Signed, STEPHEN BROWN, *Chairman.*
JOHN STEARNS.
JOHN JAMES GRAVES.

By Feb. 2, 1830, Dr. Richard Pennell, chairman, was enabled to report to the State Society: "That the apothecaries and druggists in the city of New York had organized themselves into a College of Pharmacy and adopted a constitution and by-laws. They had also appointed two professors, viz., Dr. Torrey, on Chemistry, and Dr. Stephen Brown, on Pharmacy and Materia Medica, with about one hundred students attending the former course, and about fifty the latter." A copy of their constitution was respectfully submitted first to the County Society, and next to the State Medical Society.

It should not be beneath the dignity of the New York Obstetrical Society, or of the Obstetric Section of the Academy of Medicine, or of a committee of the Medical Society of the County of New York, or of the Adjunct Professors of the Medical Colleges, or the Women's Medical College, or the Medico-Chirurgical Society of German Physicians, or all of them, to give instruction to, and examine all midwives.

A certificate of competency from individual physicians, however exalted they may be, should no longer entitle midwives to Registry even by the Board of Health.

The abuses about certificates for midwives have reached the extreme of endurance. Some physicians will give a recommendation to any and every midwife who calls them in counsel. Scoundrels who have served their term in the Penitentiary are now issuing such certificates; the makers of forged diplomas also issue forged certificates, and the holders of forged diplomas are doing the same. These men generally associate themselves in companies of three, pretend to give some instruction, and sell their certificates to midwives at from $30 to $100.

The County Society gave us the United States Pharmacopœia, the first system of Medical Ethics, the College of Pharmacy, and why not a well-regulated Society of midwives?

THE HOMŒOPATHIC QUESTION IN CONNECTICUT.

PROBABLY no question has excited as much interest in the Connecticut State Society as that referring to the propriety of consulting with homœopaths. It is not surprising that the members were unprepared to discuss it on its general merits, as the case in point was not by any means a leading one. It appears that one physician of the regular school was expelled from his County Society for consulting medically with his wife, who was a homœopath, and the case came up before the State Society on an appeal. There is something so supremely ludicrous about the whole affair, that it is easy for us to believe that the discussion was looked upon by the majority of the members more as a joke than anything else. As it is, we are pleased to learn that the Society finally voted as it did.

THE NEW HAMPSHIRE STATE SOCIETY.

THE New Hampshire State Medical Society held its annual session at Concord, commencing June 18th. The admission of two medical women to membership is worthy of note, and very clearly proves in what direction the popular medical sentiment is drifting. The usual number of scientific papers was presented, and evoked considerable discussion. The advocacy of a State Board of Health is a step in the right direction, and will doubtless be rewarded with success at the next legislative session.

OUR REPORTS OF SOCIETIES.

IN order to complete our reports of the Sections, and to find room for reports of State Societies, we have concluded to alter our usual arrangement of material. In the future issues we shall resume the publication of the original lectures and other material, which for reasons already given have been deferred.

Reports of Societies.

AMERICAN MEDICAL ASSOCIATION.

REPORT OF SECTIONS.

SECTION ON PRACTICAL MEDICINE, MATERIA MEDICA, AND PHYSIOLOGY.

DR. A. L. LOOMIS, of New York, Chairman.
DR. J. V. SHOEMAKER, of Pennsylvania, Secretary.

TUESDAY, JUNE 4TH—FIRST DAY.

The Section was called to order at 3 P.M. by the Chairman. In the absence of Dr. G. H. Etheridge, of Illinois, Dr. J. V. Shoemaker, of Pennsylvania, was elected Secretary.

RINGWORM IN PUBLIC INSTITUTIONS.

DR. J. V. SHOEMAKER, of Pennsylvania, read a paper upon the above subject, in which reference was made to 50 cases of the disease occurring in a school of 100 children. Diagnosis was made by microscopic examination. Inoculation upon unaffected children produced the same disease. Experiments were made by inoculating cats, and the disease was produced upon the animals. Further experiment demonstrated that the disease could be transmitted from animals to children by inoculation. The conclusion, therefore, was that ringworm could be transmitted from children to animals and *vice versa*. The treatment consisted in shaving the head [frequently in pulling out the hairs], frequent change of clothing, thorough ablution, the use of bitter tonics, iron, and cod-liver oil,

and the application of salicylic acid and citrine ointment.

Dr. S. S. Cutler, of Cold Water, Mich., who had charge of the only State institution in this country for abandoned children, remarked that the occurrence of ringworm in scrofulous and syphilitic children was very frequent.

Dr. W. W. Avery, of Hartford, Conn., had employed Labarraque's solution with success in the treatment of this affection.

Dr. T. C. Rich, of Philadelphia, participated in the discussion, after which the paper was referred to the Committee on Publication.

SOME FACTS IN CONNECTION WITH PULMONARY TUBERCULOSIS AND ITS HYGIENIC SURROUNDINGS.

Dr. F. H. Davis, of Chicago, read a paper upon this subject, in which he maintained that the influence of climate in the production of tuberculosis was overrated. More powerful causes were want of exercise, improper clothing of the body, and dampness.

A change from agricultural to manufacturing pursuits was regarded as an important factor in the production of phthisis. As illustrative of that view reference was made to the Swedish and Norwegian emigrants, who usually came from agricultural districts, but when they arrived in this country many of them engaged in manufacturing pursuits, their children as domestics, and among them phthisis was of frequent occurrence. Preventive measures for phthisis consisted largely in the improvement of hygienic surroundings. The use of open fire-places and the abandonment of coal stoves was urged.

Dr. Dennison, of Colorado, spoke of moisture as an element in the production of phthisis, especially moisture such as the inmates were exposed to in houses which were built upon soil more or less filled with water, as in many of our cities.

Dr. Lester, of Kansas City, Mo., did not believe that moisture had any special influence in the development of phthisis, and cited as evidence the fact that in many localities consumption was unknown while the forests remained undisturbed, but as soon as they were cleared off phthisis had appeared.

Discussion was continued by Dr. N. S. Davis, West, of New Hampshire, Scott, of Ohio, Bronson, of Massachusetts, and Caldwell, of Baltimore.

The paper was then referred to the Committee on Publication.

FIBRINOUS BRONCHITIS.

Dr. C. W. Glasgow, of St. Louis, presented a specimen of bronchial casts, with the history of the case.

Dr. Loomis referred to eight cases of the disease which had fallen under his observation. The danger in such cases was, that the disease might lead to phthisis. The only benefit which he had seen in way of treatment had been from change of climate; and a locality should be sought in which the atmosphere was free from germs.

The paper was referred back to the author, with the request that he make a full report upon the subject at the next meeting of the Association.

The Section then adjourned, to meet at 3 P.M., Wednesday, June 5th.

Wednesday, June 5th—Second Day.

The Section was called to order at 3 P. M. by the Chairman, Dr. Loomis.

The first paper was read by Dr. J. J. Caldwell, of Baltimore, on

THE NEUROSES OF THE PNEUMOGASTRIC AND SYMPATHETIC.

The anatomical distribution of the pneumogastric nerve was first considered, and the effect produced by its division. The connection of the nerve with the sympathetic was so intimate, that when the sympathetic was irritated the same symptoms might be developed as when the pneumogastric itself was irritated. The author then passed to the consideration of the diseases affecting organs which were supplied by the pneumogastric, such as epilepsy, laryngismus stridulus, whooping-cough, croup, diphtheria, aneurism, etc. Mention was also made of certain neuralgias of the pneumogastric and sympathetic, and the views of the author were illustrated by cases. The object of the paper was to call attention to the neuralgias of the sympathetic and the pneumogastric, and also to study the vaso-motor centres, especially the sweat centres of the sympathetic. The use of electricity was referred to in the treatment of the various neuralgias mentioned.

METRIC SYSTEM IN MEDICINE.

Dr. Edward Wigglesworth, of Massachusetts, read a paper upon the above subject, in which were set forth the principles of the system, and the advantages that would follow its adoption in medicine.

On motion made by Dr. N. S. Davis, the paper was referred back to the author, with the recommendation that it be published in some medical journal, including the statement that it had been read before that Section of the American Medical Association.

Dr. Davis then moved that the Section, by resolution, recommend the adoption of the metric system in medicine. Carried.

PRACTICAL POINTS IN THE ELECTRICAL TREATMENT OF IMPOTENCE AND SPERMATORRHŒA.

The above was the title of a paper read by Dr. G. M. Beard, of New York.

The points in the paper were as follows:

1. That in the electrical treatment of *seminal emissions* mild currents should be used and short applications; strong currents and long applications were liable to produce irritation.

He preferred the ordinary steel sound as an electrode instead of the "urethral electrode."

2. In the electrical treatment of *impotence* a strong current might be used, faradic or galvanic, but usually the faradic was preferable. In cases of anæsthesia of the parts, the faradic current might be used with the wire brush.

3. Where the impotence or spermatorrhœa had produced general debility, central or general galvanization, either one, might be used in connection with local treatment. The galvanic current should not be used within the urethra, as it might produce too much chemical action.

4. The cooling catheter, the so-called Winternitz sound, was an excellent adjuvant and positive addition to our methods of treatment of these affections. It was an instrument so constructed that water could be poured into one end of a tube, and running the entire length of the sound, returned and was emptied at the other. He connected the catheter with a Potter's hydrostatic bag, and used water having a temperature of 40° or 50° F. The effect of the cooling application was to contract the urethra so that the instrument was removed with some difficulty. The applications could be continued from five to seven minutes. In some cases he connected a similar arrangement for the rectum. Instead of the hydrostatic bag an ordinary

Davidson's syringe might be used for injecting the water.

5. Dr. Beard spoke of Johnson's electric self-monitor. He was not able to say how much value the device possessed. Generally all those devices had been failures, and the fear was with reference to Johnson's apparatus that it would prove to be an irritant. In brief, the monitor consisted of an electric battery and connections so arranged that a shock was given when a ring was opened by the erected penis.

6. Treatment by the alternate use of hot and cold applications, such as flannels wrung out of hot and cold water, to the perineum and upon the back where the pain was located.

7. Internal treatment consisted in the use of gelsemium, bromide of camphor, ergotin, and lupulin. Gelsemium alone was of more value than was usually supposed. A pill made up somewhat as follows might be used:

℞ Gelsemium ..... ½ gr.
Bromide camphor ..... 1½ grs.
Ergotin and lupulin ää ..... ¼ gr.

He sometimes used bromide of zinc and valerianate of zinc combined, ää gr. i., given in the form of pill, and gradually increasing the dose.

8. Hygienic treatment. Dr. Beard thought that the absolute-rest treatment was sometimes carried too far in these cases, and that a little exercise might be beneficial.

9. Prognosis in spermatorrhœa was not so good as in impotence, although in the great majority of all the cases recovery took place.

Dr. Beard's paper was discussed at some length by Drs. Caldwell, of Baltimore, Rich, of Philadelphia, Hibbard, of Indiana, Palmer, of Michigan, Bronson, of Massachusetts, Shoemaker and Woodbury, of Philadelphia.

It was finally referred to a Sub-Committee, consisting of Drs. Palmer, Hibbard, and Bronson.

THURSDAY, JUNE 6TH—THIRD DAY.

The Section was called to order at 3 P.M. by the Chairman.

DR. THOMAS F. ROCHESTER, of Buffalo, gave the history of the case and presented a specimen illustrating

SEPARATION OF THE ILEUM AND SPONTANEOUS OCCLUSION OF THE DIVIDED EXTREMITIES.

DR. MARTIN, of Mass., referred to a case in which 19½ inches of the ileum separated and were discharged. Six months subsequently the pathological specimen was obtained, when it was found that the extremities of the gut, where the slough had occurred, had been united by a narrow band which was pervious.

DR. LOOMIS said that he had seen one case similar to that reported by Dr. Rochester, except that the extremities where the gut had sloughed were agglutinated to each other.

The paper was referred to the Committee on Publication.

DR. C. N. PALMER, of Lockport, N. Y., read a paper

ON GOITRE SUCCESSFULLY TREATED BY SUBCUTANEOUS INJECTION OF FLUID EXTRACT OF ERGOT.

The paper consisted substantially of the history of two cases of goitre, which had been successfully treated as above indicated. From ten to twenty minims of Squibb's fluid extract were used at each injection. One of the patients cured was exhibited to the Section. He was twenty-five years of age; his neck measured twenty-five inches in circumference when treatment was commenced; the enlargement was double, one side cystic and the other solid.

Several methods of treatment were mentioned by members of the Section, and Dr. Davis remarked that no doubt some cases had been cured by any method which had been suggested.

On motion, Dr. Ephraim Cutter's paper on the "Morphological Changes in Syphilitic Blood" was referred to a special committee, consisting of Drs. Thomas F. Rochester, J. R. Bronson, and N. S. Davis.

On motion, the Committee of the Section, whose duty it was to report regarding the meteorological changes and the commencement of intestinal diseases, was continued.

THE CHAIRMAN'S ADDRESS.

On motion by Dr. N. S. Davis the chairman's address was taken up for discussion. Commendatory remarks were made by Drs. Davis, Rochester, Bronson, Bell, and Dennison.

On motion, the Chairman of the Section was requested to publish his address in some medical journal, in order that the profession might have opportunity for its study before it appeared in the volume of Transactions.

DR. N. S. DAVIS stated that it was in violation of the By-laws to give a paper to a medical journal for publication which had been referred to the Committee on Publication by the Section.

The *Chairman* said that he did not wish to have his paper to take any course which was not in accordance with the By-laws regulating the disposal of papers read before the Section.

The discussion terminated in sending the paper to the Committee on Publication, and also in the adoption of a resolution which was reported, and appears in the minutes for the fourth day of the General Association.

On motion made by Dr. N. S. Davis, Dr. Dennison was requested to report at the next meeting on the results of climatic treatment of phthisis in Colorado.

The Section then adjourned.

SECTION ON STATE MEDICINE AND PUBLIC HYGIENE.

DR. J. L. CABELL, of University of Virginia, Chairman.
DR. I. N. QUIMBY, of New Jersey, Secretary.

TUESDAY, JUNE 4TH—FIRST DAY.

The Section was called to order at 3 P.M. by the Chairman.

The first paper was read by DR. HENRY I. BOWDITCH, of Boston, entitled,

STUDIES OF AN EPIDEMIC OF DIPHTHERIA WHICH PREVAILED AT FERRISBURG (ADJACENT TO VERGENNES), VERMONT, DURING THE SUMMER OF 1877.

Dr. Bowditch spent three days in the investigation, and entered all the houses of the district to which the epidemic was chiefly limited. A description of the locality, and the character and number of the homesteads was given, and the gradual progress of the disease traced upon the map. It was reported that the disease attacked principally, if not wholly, those who drank water from a certain well which had been long disused; but the perfect proof that such was not the source of the disease was the fact that several persons who drank of the water did not have diphtheria,

and that others who purposely avoided it, were, by another means of communication, affected, and some were killed. In conclusion, Dr. Bowditch enumerated the salient points of the epidemic, together with a few reflections that were germane to the subject.

1. We had seen the vastly greater tendency of childhood than of adult life to be affected; but

2. The fact that two nursing babes escaped in the epidemic, while many older children were affected, was worthy of notice.

3. Some houses, though surrounded by the epidemic, and their inmates went among the sick, escaped, but they had only adults in them. Would it have been safe or proper for those adults to have done so if any children had been living with them? He should decidedly say "nay," for

4. Adults in the epidemic had, at times, apparently carried the contagion without having it themselves.

5. If the epidemic did not *prove* the value of cleanliness in warding off diphtheria, it did not oppose that idea.

6. The experience of the epidemic seemed to indicate that physicians should consider the possibility of their communicating the disease in going from one patient to another. He confessed that he should think it his duty to take extra precautions in regard to going from a diphtheritic patient to any other sick person without thoroughly washing his hands, and, as far as possible, disinfecting his clothing by an exposure to the air, etc. Especial precautions should be used when going from a diphtheritic case to the puerperal chamber or that of any peculiarly sensitive patient or delicate child. Were diphtheria prevailing, and were he attending puerperal cases, he should visit all such patients before seeing the diphtheria cases, and in giving that counsel he only gave that which every one would admit was correct, in case one had erysipelatous and puerperal cases to attend on the same day. For, if in the latter hypothesis we should go directly from dressing an erysipelatous patient to a case of labor, we would be guilty of the grossest folly; Dr. Holmes would say, crime. We would deserve the severest condemnation, because we risked the life of our patient for the sake of our own convenience or for our fee, which was a most contemptible and reprehensible act, and one to be condemned by every honorable physician.

Future sanitary legal enactments would, he doubted not, justly hold a physician who should be guilty of such acts in the cases supposed of erysipelas and labor, amenable to statute law as much as if he administered poison or were guilty of the grossest malpractice.

7. On the occurrence of a case of diphtheria in a pupil attending school, the greatest care should be taken to prevent the disease from becoming epidemic. The patient should be forthwith separated from his fellows, or kept from them, not only during his illness, but for two or three weeks afterwards, and should not be allowed again to attend school until in full health, nor until all his clothing had been thoroughly disinfected. Those who had been in more immediate contact with him just before the disease appeared should be carefully examined, and the question of excluding them also from the school should be decided by a medical examination. If it was evident that several children were about to be affected, the school should be forthwith closed. As many of the children as possible should be removed out of the place and kept away for several weeks until the contaminated homesteads had been disinfected.

8. All clothing used by a diphtheritic patient should be subjected to intense heat, either of dry air or of boiling water, and smaller rags or cloths used by such patients should be burned.

9. Each room in which a diphtheritic patient had been ill should be thoroughly ventilated during the illness of the patient, and afterwards continued for a time with thorough disinfectants.

10. Upon the death of a patient, the body should be as soon as possible placed in a box so constructed that no effluvia could escape. The funeral should be very soon after death, and attended by the fewest possible. The neighbors and friends and children of the family and all others should be excluded, except those needed to assist.

11. Finally, it was suggested by one of the attending physicians if the people of that small district had, early in the epidemic, established a temporary hospital, some lives might have been saved. A large hospital-tent upon one of the adjacent hill-tops, into which every one taken ill could have been immediately transferred, would perhaps have acted as the Botsford homestead apparently did, viz.: converted a widely prevalent and at times fatal disease into one milder, and, perchance, non-fatal. In the depths of winter-time perhaps one of these houses, or even a barn, might be fitted up for the same purpose.

The sum-total of these suggestions came to this result: An epidemic or a single case of diphtheria must be met very much as we would meet a case of small-pox or scarlatina, and we must try by every means in our power to limit its influence and prevent its spread as an epidemic. He did not mean to intimate that he thought diphtheria equally contagious as small-pox; but that there was a strong analogy between them, like means used to prevent their spread.

At the conclusion of his paper, Dr. Bowditch moved that it be referred to a committee of experts. Pending the vote on this motion, the paper was discussed by Dr. Jacobi and Dr. Bell, of New York, Dr. Hollister, of Chicago, Dr. Noyes, of Detroit, and Dr. Seguin, of New York.

Dr. Toner moved as an amendment to the motion of Dr. Bowditch, that the paper be referred to the Committee on Publication. Dr. Jones, of Toledo, in seconding the motion, took occasion to speak of contagion and infection, their causes, etc.

After further remarks by Dr. Jacobi, and Drs. Knight and Isham, of Connecticut, the vote was taken on the amendment of Dr. Toner, and it was carried.

INTERVENTION OF PHYSICIANS IN EDUCATION.

Dr. E. Seguin, of New York, read a paper upon the above subject, in which the imperfection of our American public schools were pointed out, and reference made to the part which the physician should take in the education of the children as follows:

During vacation he should inspect the school-house and grounds with reference to cleanliness and drainage, and see that they were shaded on the proper side; that the books, charts, images, and the like were duplicated in several types to suit the different conditions of vision; that the desks fitted the progressive ages, and the seats the diversity of shape of the children, particularly of the girls.

Before entering the school the pupils should be scrupulously examined, and their status minutely recorded in regard to their general appearance; condition of skin and glands; relations of age to size; relations of size to weight; of trunk to limbs; conformation and proportions of head; irregularities of both sides; spinal anomalies (carefully surveyed); breadth and thickness of the chest; circulation; respiration, etc., etc.

Before having allotted a child to a class-room and

in it to one place in relation to the teacher and teaching apparatus, the precision of his sensory organs, and particularly wherefrom he could see and hear best, should be considered. Otherwise placed, his senses might grow worse; or the erectile tension of their organs, which caused the attention of the mind, being found useless would slacken, and the desire for learning would die away in proportion to the impairment of the senses.

Dr. Seguin then directed attention to the question of myopia and other eye affections, to quarantine measures against introducing contagious diseases into the school, to noting the effect of the course of studies upon the children, to the physiological training of the senses, and to the records of vital powers.

"The true riches of the country, without which all others are like chips in the mouth of the hungry, are our children, if physiologically educated."

Dr. Seguin's paper was endorsed by Dr. Bell, of Garden City, Dr. Jones, of Toledo, Dr. F. H. Hamilton, of New York, Dr. Noyes, of Detroit, Dr. Storer, of R. I.; and, on motion, Dr. Hamilton was requested to present an outline of the paper to the general session of the Association.

The Section then adjourned, to meet on Wednesday at 3 P.M.

WEDNESDAY, JUNE 5TH—SECOND DAY.

The Section was called to order at 3 P.M. by the Chairman.

The minutes of the previous meeting were read and approved.

CROUP AND DIPHTHERIA.

Discussion upon the contagiousness of croup and diphtheria was continued by Dr. A. Jacobi, of New York; Dr. Wilcox, of Hartford; Dr. Abbott, of Hamburgh; Dr. R. J. O'Sullivan, of New York; Dr. Reeves, of Wheeling; and others.

RESOLUTION BY DR. BELL.

DR. BELL, of New York, offered the following resolution, which was adopted:

"*Resolved*, That Dr. E. Seguin's paper on the Intervention of Physicians in Education be recommended for publication in the Transactions, and that Drs. F. H. Hamilton, E. Seguin, R. J. O'Sullivan, of New York; Dr. D. B. Lincoln, of Boston; Dr. W. H. Van Bibber, of Baltimore, be appointed a committee to report to the Association at its next meeting upon the practical suggestions of the said paper.

JOHNS HOPKINS HOSPITAL.

DR. J S. BILLINGS, U.S.A., of Washington, exhibited the plans of the Johns Hopkins Hospital, to be erected in Baltimore, showing improved plans of ventilation and drainage.

DR. JONES, of Toledo, moved that Dr. Billings be requested to prepare a paper on the construction of hospitals, to be read at the next annual meeting of the Association. Carried.

On motion, the communications in reply to the circular of the Chairman of the Section, on Defective Drainage and Water Supply, by Drs. T. M. Stevens, of Indiana, John W. Trask, of Missouri, and A. M. Carrigan, of Arkansas, were referred to a committee consisting of the Chairman and Secretary of the Section.

The Section then adjourned to meet at 3 P.M. on Thursday.

THURSDAY, JUNE 7TH—THIRD DAY.

The Section was called to order at 3 P.M. by the Chairman.

DR. A. N. BELL, of New York, was elected Secretary.

The minutes of the previous meeting read and approved.

A letter from Dr. F. H. Hamilton, of New York, was read, declining, for want of time, to report at the next meeting of the Association on the subject discussed in Dr. Seguin's paper.

The address of the Chairman was taken up, discussed, and, on motion made by Dr. Bell, of New York, referred to the Committee on Publication.

THE BEARINGS OF HYGIENE ON THERAPEUTICS

was the title of a paper presented by DR. J. R. BLACK, of Newark, Ohio, and read by the Chairman of the Section.

The writer concluded his paper as follows:

TREATMENT OF CHRONIC INTERMITTENT FEVER.

"A pathological therapeutist is very apt to treat a chronic intermittent thus: a mercurial cathartic to clean out the abdominal viscera, then quinine in large doses, and if this does not succeed, then in larger and yet larger, to destroy or neutralize the hypothetical malaria in the system. Cases have I seen by the score who had received such treatment for weeks and months unavailingly, who had taken quinine and iron until they were, as they expressed it, almost blind and deaf, and yet the disease persisted, with very brief cessations. As a hygienic therapeutist, and as one who has had a large experience with chronic intermittents, I unhesitatingly affirm of this latitude, that scarcely a case of intermittent fever need ever become chronic, and that even when so, proper management will hold the symptoms under control until the tendency is wholly overcome. The outline of the method is as follows: Inquire carefully into the history of the case, and whether acclimated or not, directing special attention to each of the abdominal organs, and if much deranged administer the best active corrective at once. Then anticipate the next paroxysm with 12 grains quinine, divided into three doses, beginning its administration eighteen hours before the time of the expected chill. Repeat this amount of quinine every seventh day for four consecutive weeks, but at no other time, except when the patient's indiscretion brings on an irregular paroxysm. During the intervals administer daily gentle remedies appropriate to correct the functions that show the most derangement. These remedies should be such as will keep the organs mainly at fault up as near as possible to the standard of healthy action, and no more, never allowing the secretions or excretions of any organ to sink far below the healthy standard, nor causing them to rise much above it. The diet should be strictly hygienic, and so also of the exercise, not permitting the vital energy to be spent in toil that should be devoted to recuperation. To guard against external variations of temperature, especially in the unacclimated, flannel should be worn next the skin. The grand condition of success lies in the method and means for keeping all the abdominal organs, during every day and for several weeks, up to the standard of healthy action, and thus triumphantly raise the health above the ague-point. Quinine is invaluable for the arrest of periodicity, but nothing more. By these means my success in treatment has been immediate, and invariable even in

those cases in which improper management had led to serious derangement of the liver, with enormously enlarged spleen. An attempt to trace the course of thought that led these to therapeutical modifications leads back to the careful study of etiology and hygiene, and it is to these that I must attribute the many changes that I have been induced to make in the management of nearly all chronic diseases—changes that I have abundant evidence to consider, constitute a most important advance over old-time methods."

The paper was referred to the Committee on Publication.

The resignation of Dr. Hamilton, as Chairman of the Committee on Dr. Seguin's paper, was accepted, and Dr. R. J. O'Sullivan, of New York, appointed to fill the vacancy.

The Section then adjourned.

SECTION ON MEDICAL JURISPRUDENCE, CHEMISTRY, AND PSYCHOLOGY.

DR. WALTER KEMPSTER, of Oshkosh, Wis., Chairman.
DR. WM. COMPTON, of Holly Springs, Miss., Secretary.

WEDNESDAY, JUNE 5TH—SECOND DAY.

The Section was called to order at 3 P.M. by the Chairman.

The Chairman, Dr. Kempster, read a paper on

GENERAL PARESIS OF THE INSANE.

It was discussed by Dr. Compton, Dr. Clarke, of Toronto, Dr. Russell, of Mass., and Drs. Gray and Deecke, of Utica, N. Y. Dr. Compton remarked that he had never seen a case of paresis in the negro insane.

The paper was referred to a Sub-Committee, consisting of Dr. Darrin, of Penn., Dr. Compton, of Miss., and Dr. Hildreth, of W. Virginia.

The Section then adjourned, to meet at 3 P.M. on Thursday.

THURSDAY, JUNE 6TH—THIRD DAY.

The Section was called to order at 3 P.M. by the Chairman.

THE USE OF THE MICROSCOPE IN THE STUDY OF DISEASES OF THE BRAIN.

DR. THEODORE DEECKE, of Utica, N. Y., read a paper on the above subject, and illustrated it by means of micro-photographs, prepared by himself and Dr. Gray.

DR. KNIGHT, of Connecticut, offered a few remarks upon the same subject.

The paper was referred to the Sub-Committee, and on motion by Dr. Compton the Section adjourned.

NEW HAMPSHIRE STATE MEDICAL SOCIETY.

Eighty-eighth Annual Meeting.

DR. L. M. KNIGHT, OF FRANKLIN, N. H., PRESIDENT, IN THE CHAIR.

(Special report for THE MEDICAL RECORD.)

TUESDAY, JUNE 18TH—FIRST DAY.

THE eighty-eighth annual meeting of the New Hampshire Medical Society was held in Rumford Hall, Concord, on Tuesday, June 18th, at 11 A.M. The attendance was large. The President, Dr. L. M. Knight, of Franklin, occupied the chair.

Prayer was offered by Rev. Daniel C. Roberts, of St. Paul's Church; and thereafter the customary committees for immediate temporary purposes were appointed.

FEMALE MEMBERSHIP.

The report of the Council concerning applicants for admission to membership was read by the Secretary, and the names of thirty-one were balloted for, all of whom were admitted. Among them were two ladies, Drs. Mary Danforth, of Manchester, and Julia E. Wallace, of Concord. These are the first lady physicians ever admitted members of the Society. Two members were retired on account of age and of removal.

REPORTS OF DELEGATES.

The Committee on Credentials, etc., reported that the Connecticut River Valley Medical Association was represented by Dr. L. Sawyer, of Springfield, Vermont; the Vermont Medical Society, by Dr. D. F. Rugg, of Hartland, Vermont; the Massachusetts Medical Society, by Drs. Ira Russell, of Winchendon, Edward Wigglesworth, of Boston, and John H. Mackie, of New Bedford; and the New York Medical Society, by Dr. L. D. Bulkley, of New York. These gentlemen were invited to share in the Society's deliberations, and to participate in its hospitalities.

The Secretary, Dr. CONN, made a report on the Collation of the Early Records of the Society, which duty was unfinished; and Drs. Hill, of Dover, Crosby, of Concord, and Frost, of Hanover, were appointed to complete the work begun by Dr. Smith, and report to the Council at next annual meeting.

STATE BOARD OF HEALTH.

The Secretary also made a report concerning the efforts made by the Society to induce the State Legislature to establish a State Board of Health, which had failed, the while vastly inferior popular interests had succeeded. The report urged that nothing could be accomplished, unless through persistently knocking at the door of the Legislature, and the members be made to seriously listen to the just demands of enlightened humanity. The Society resolved to continue its efforts for the establishment of a State Board of Health, and Drs. Stackpole, Crosby, and Russell were appointed a Special Committee to take charge of the matter.

PRESIDENT KNIGHT then delivered the annual address, after which the meeting adjourned to Odd Fellows' Hall, in order to enjoy their annual dinner. Dr. L. B. How, of Manchester, presided, and the season of physical and mental enjoyment was a happy one.

At 3 in the afternoon the Society reassembled, and the following papers were read:

DR. T. J. W. PRAY, of Dover:—"The Modern Use of Stimulants in Disease; Has there been a Change in the Type of Disease?

[In the discussion which was invited it was held, substantially, that while there was just attachment to old methods of treating typhoid disease, the change of circumstances of a large portion of the people—their aggregation in large cities and towns, where confined dwelling places and vitiated air predominated—had changed the types of the disease, and had sanctioned the use of newer remedies—among them stimuli—which had thirty years ago been largely excluded in practice. There seemed a general favor towards feeding in cases of typhoid fever.]

MANAGEMENT OF THE INSANE.

By common request DR. KINGSBURY, of Lyme, was

solicited to provide a paper, to be read at next meeting, "On the Use of Stimulants in Cases of Typhoid Fever."

2. By Dr. E. E. Graves, of Boscawen (per Dr. G. P. Conn, of Concord), a paper "On some of the Risks and Responsibilities connected with the Practice of Medicine and Surgery."

3. By Dr. J. P. Bancroft, of Concord, "Concerning the Pauper Insane in New Hampshire." This paper urged the more extended study of mental diseases by the profession; the special claims the afflicted had on professional and State guardianship; the impolicy of allowing the insane paupers to be treated in common with the sane paupers—a peculiarity of New Hampshire alone.

[On motion of Prof. Frost, of Dartmouth, the Secretary was instructed to lay Dr. Bancroft's paper before the Legislature as the sentiment of the Society on its subject, and Dr. Stillings, of Concord, was appointed his coadjutor.]

4. Dr. William Child, of Bath, read a paper "On Surgery: Its Social Relations and its Status as a Science and an Art." He held that the position of a surgeon was a high and influential one, and its keynote fidelity to duty; but demands were made which invaded all just sense of his responsibility. One was that which compelled him, in testifying before courts of law, to disclose professional secrets, from which compulsion priests and lawyers were excluded. A change of law in this respect was strongly urged.

5. By Dr. G. M. Garland, of Boston: "On Thoracentesis."

The evening session of Tuesday was devoted to the reading of obituary notices, five members of the body having died during the past year.

Dr. A. H. Crosby, of Concord, made a brief report on the subject in hand, and proceeded to read a sketch of the late Dr. John E. Tyler, some time in charge of the New Hampshire Asylum for the Insane. It credited him with sound ability in the treatment of mental disease, and related his extended experience, and the fame he had attained in his specialty.

Dr. Parsons, of Portsmouth, next read a notice of Prof. A. B. Crosby, written by Dr. J. W. Barstow, of Flushing, L. I. This paper was intimately biographical.

Dr. A. H. Crosby next read a notice of the late Dr. George E. Hersey, of Manchester.

Dr. Hanks, of New York, then read an obituary of the late Prof. E. R. Peaslee, of Dartmouth.

Dr. Wight, of Gilmanton, read a well-written paper respecting the character and attainments of the late Dr. Isaac S. French, of Loudon.

An obituary of Prof. Albert Smith, of Peterborough, by Prof. Field, of Dartmouth, was read by its title, and all the obituaries were referred to the Publication Committee.

Wednesday, June 19th—Second Day.

At the opening of Wednesday morning's session Dr. D. S. Adams, of Manchester, read a paper "On Carcinoma: Its Histology and Ætiology."

Dr. Bulkley, of New York, gave an illustrative lecture on the application of rubber bandaging for the cure of ulcerated limbs, and of old ulcers.

The following officers were elected for the ensuing year:

President, Dr. A. F. Carr, of Goffstown; *Vice-President*, Dr. T. J. W. Pray, of Dover; *Secretary*, Dr. G. P. Conn, of Concord; *Assistant Secretary*, Dr. Carter, of Concord; *Treasurer*, Dr. L. B. How, of Manchester.

The reports of District Societies were severally read by their titles and referred to the Publication Committee.

It was voted to hold the next meeting of the Society at Concord, on the third Tuesday in June, 1879.

A resolution was unanimously passed urging it on legislature, municipal and town officers, to provide every necessary, legal, and local measures to prevent danger and death caused by *rabies canina*.

Dr. Hill gave a description, from a specimen, of the various uses and great value of Trussell's Universal Adjustable Splints.

The Isles of Shoals was selected as the place where the semi-annual meeting of the Society should take place.

The unanimous thanks of the Society were tendered to the past President for the able and impartial manner in which he had discharged his duties; also to Dr. Wheat, the retiring Treasurer; and thereafter the Society finally adjourned.

CONNECTICUT MEDICAL SOCIETY.

Eighty-seventh Annual Meeting, May 22d and 23d.

Dr. R. Hubbard, President, in the Chair.

(Special Report for The Medical Record.)

First Day—May 22d.

The Eighty-seventh Annual Convention was held in New Haven, May 22d and 23d, and was an unusually interesting and well-attended meeting. The eight County Societies which together compose the State Society were all well represented by their delegates in the business session, and the profession generally in the State. On the second day Drs. R. F. Weir, from New York, J. H. Bronson, from Massachusetts, and E. M. Moore, from Maine, were present as delegates, and in brief speeches presented the greetings of their respective Societies.

In accordance with custom, the President briefly addressed the Convention, calling to their attention the principal matters of business to come before them, reviewing the history of the year and the status of the profession.

Address of President.

"To-day, legitimate medicine may be said to be without an important rival; the rapid succession of discoveries relating directly or indirectly to our profession have destroyed the foundations of all opposing systems, and it only remains for us to await popular comprehension of the fact that what seems to be opposition is but a distinction without a difference. The necessity thus imposed upon us for broad culture and high attainment in entering upon a theatre of labor thus extended might well discourage the most zealous and persevering, and necessitates the distribution of the field into the various specialties for a thorough mastery of particular branches, as well as for rapid general progress in all. The burdensome and increasing duties of our professional life should incite us to renewed efforts to promote the efficiency of our organizations and in diffusing knowledge among the people. In the establishment of a State Board of Health, a new field is opened for our efforts; and let us hope that the same determined spirit that persisted through many years of discouraging labor will manifest itself in ways and means to promote its efficiency."

After the usual routine business of organization, several amendments to the By-laws were acted upon, regulating representation, and authorizing the Secretary to fill vacancies in the delegates to any Society.

The following new By-law was offered, passed as a resolution, and lies over a year by rule:

DOGMATISTS AND MEDICAL TRAMPS.

"*Resolved*, That any County Society may examine, discipline or expel any member notoriously in the practice of allopathy, homœopathy, hydropathy, or according to any exclusive system or dogma."

Dr. S. G. Hubbard, of New Haven, introduced a memorial from that city concerning medical tramps and the laws relating to the profession in the State. It was referred to a committee to report at the evening session.

THE POWER OF GRANTING LICENSES.

The subject of granting licenses, the power to license being still possessed by the Society, in the case of those not possessed of the qualifications for a degree, was warmly discussed. There is a strong sentiment in the profession in this State in favor of a better standard of medical education, and in view of the comparative ease of securing a diploma, the power of licensing is entirely unnecessary and uncalled for, and its exercise anything but honorable to the profession. Indeed, it has not been exercised for many years, and was generally supposed to be obsolete, to be retained for some possible emergency that might arise.

The degrees are granted here by a conjoint committee composed of the Professors of the Yale Medical School and as many from the State Society, and the power to license belongs to the committee from the Society. The Medical School at Yale has advanced as far in efforts to elevate the standard of medical education as charter limitations will allow, and the discussion of the subject resulted in the passage of the following resolution, which will probably eventuate in measures to either abolish the power of licensing, or render the qualifications the same as for a degree, and enable the Medical School to advance the standard of medical education unhampered by the present charter regulations:

"*Resolved*, That the Connecticut Medical Society be requested to appoint a committee of three to confer with a similar committee, representing the Medical College, to consider the propriety of making some changes in the Medical Institution of Yale College, with authority to co-operate with said committee in securing from the Legislature such alterations as may be mutually agreed upon."

The President appointed the following committee: Drs. C. W. Chamberlain, S. H. Wood, H. P. Stearns.

The Committee on Nominations made their report, and the following officers were elected:

C. M. Carleton, M.D., *President;* A. R. Goodrich, M.D., *Vice-President;* F. D. Edgerton, M.D., *Treasurer;* C. W. Chamberlain, M.D., *Secretary.*

The Treasurer's report was presented, showing an increase of $140 over the balance of last year, and presenting an encouraging prospect for the future. In three of the counties there is now no indebtedness or arrearages—Middlesex, Hartford, Tolland—and in three others but slight, and less than usual in the others.

The Society reassembled at eight P.M., Dr. C. M. Carleton in the chair, in the absence of Dr. R. Hubbard, the President.

The Committee on the New Haven Memorial presented a report in favor of efforts by this Society to secure an act to regulate the practice of medicine, and to keep medical tramps from this State. After considerable discussion a committee of one from each county was appointed to report a bill to the next Convention, and to the County Societies.

CONSULTING WITH A HOMŒOPATH.

A case of discipline, which had at the commencement of the afternoon session been referred to a committee, was then considered, two reports being presented. The case had previously been considered in the Fairfield County Society, and the doctor expelled from the Society, but the sentence required the sanction of the State Society. The charge was that of consultation with a homœopathic practitioner, said practitioner the wife of the defendant. The majority reported the charges not proven, and, as the *prima facie* evidence would not warrant acquittal, referred the matter back to the County Society, which had not been unanimous in its action. The minority report sustained the action of the County Society.

After a protracted debate, lasting until midnight, the majority report was accepted.

THURSDAY, MAY 23D—SECOND DAY.

The Society was called to order at nine A.M., Dr. R. Hubbard in the President's chair. Dr. C. W. Chamberlain at the Secretary's desk. The report of the Secretary was presented, as follows: "Sixteen members of the Society have died since our last meeting, a very large mortality, but the average age, 64, exceeds that of the general average in the profession, which is about 58. The oldest was 87, and several over 70; the youngest 29. There were 31 new members added, and after subtracting the removals a net gain of 11. The Society now numbers 395."

The annual address of the President treated of the relations of the regular profession to the public, and presented an outline of the various "isms" that opposed the progress of regular medicine, and of the benefits conferred upon humanity by the discoveries and improvements in scientific medicine.

THE MANAGEMENT OF THE INSANE.

The dissertation by Dr. A. M. Shew, of Middletown, presented the relations of insanity to law, discussing the tests for insanity, especially the knowledge of right and wrong, which was condemned as an unreliable, insufficient test, the treatment of the insane, and the pleas of insanity as a bar to legal procedures. It was a very able and scholarly paper, evidently the result of much thought and study.

MATTERS OF PROFESSIONAL INTEREST.

The report of the Committee on Matters of Professional Interest was read by the Chairman, Dr. Wainwright. The questions sent out this year involved the etiology of the zymotic diseases, especially typhoid fever and diphtheria. There are, judging from the replies, two theories held concerning the origin of zymotics here as elsewhere:

1. The theory of a specific poison, whether bacterial or chemical.

2. The sporadic origin, from unsanitary conditions, without infection from preceding cases.

Among the rural practitioners the view of sporadic origin is numerically stronger, and seems to be in accord with experience.

There has been no widespread epidemic locally. Diphtheria has prevailed extensively, causing 590 deaths in the State. The question of vaccination is also discussed. The bovine virus is used generally, with satisfaction as to results and protection. Occasionally severe results, like erysipelas, have followed.

but rarely. The percentage of successful vaccinations is encouraging, and, in fact, the people have become educated up to the point of demanding the bovine virus.

Several interesting essays were read by appointment. Dr. L. S. Paddock read an essay on Puerperal Convulsions; Dr. Swasey, on Uterine Hemorrhage; Dr. S. H. Chapman, on Therapeutics of Throat and Ear Disease.

A very instructive demonstration of the methods of antiseptic surgery was given by Dr. G. P. Davis, followed by Drs. Bronson and Weir, who gave the results of the use of the method in Boston and New York.

STATE BOARD OF HEALTH.

The report of the Committee on State Board of Health reported, through Dr. Lindsley, the success of their efforts. The committee acted in concert with one from the American Medical Association, and by persistent effort a satisfactory bill was passed. The care of the vital statistics is given to the Board, and ample powers for sanitary inspection and work. The following appointments were made by the Governor:

J. S. Butler, M.D.; C. A. Lindsley, M.D.; R. Hubbard, M.D.; A. E. Burr, Prof. Wm. H. Brewer, A. C. Lippitt.

There is one lawyer, one editor, and a Professor from Sheffield Scientific School; the others physicians.

Voluntary communications occupied the remainder of the session:

Thoracentesis in Empyema; Four Cases, with Recovery—Jas. E. Barbour, M.D.

Hemiplegia Alternans—W. C. Burke, M.D.

Stammering the Result of Railroad Injury—P. A. Jewett, M.D.; and others, principally reports of unusual cases.

The annual dinner was served at the New Haven House, and was, as usual, a very enjoyable affair, giving the opportunity for relaxation and recreation after a somewhat exciting and laborious session.

NEW YORK PATHOLOGICAL SOCIETY.

Stated Meeting, April 24, 1878.

DR. J. C. PETERS, PRESIDENT, IN THE CHAIR.

OBSCURE CASE OF CANCER OF THE LIVER.

DR. BLUMENTHAL presented a specimen taken from a lady aged sixty-six years, the mother of six children. Ten or twelve weeks ago she consulted Dr. B. for undefined pains along the lower part of the bowels, which she attributed to constipation. Slight purgatives were accordingly administered. An external examination failed to give any evidence of special trouble. No relief having been obtained, a rectal examination was made with the result of finding a large accumulation of fæcal matter in the neighborhood of the sigmoid flexure. All that could be found by careful external manipulation associated with this condition was a sense of fulness over the left inguinal region. After the bowel had been thoroughly cleansed by enemata, another rectal examination revealed the existence of a hardened growth three and one-half inches from the anus. The diagnosis made was that of cancer of the rectum. She was very comfortable from that time for about three or four weeks, when she was examined again; this time with the result of finding a hard tumor on the right side, occupying the position of the ileo-cæcal portion of the intestines, and extending to the median line and upward toward the region of the liver. It could be pressed with considerable force without exciting pain. Of course its connection with the hard body in the intestine was suspected. She was seen in consultation about this time by a medical gentleman of this city who diagnosticated accumulated fæces and recommended appropriate treatment therefor, which, as was anticipated, was not successful. It was subsequently determined that he should make a more thorough examination of the bowel, when it was ascertained that a stricture existed just above the hard tumor, and through which stricture it was almost impossible to introduce the tip of the finger. In the meantime the patient became very much demoralized, lost her appetite, and soon died.

At the autopsy the organ most prominently affected was the liver, which was very much enlarged and filled with cancerous material. It was the right extremity of this liver which was mistaken for fæcal impaction, but was not traced to the organ because the transverse colon which passed over it was much distended with gas. That fæcal accumulation was suspected to be the cause of the tumor rested in the mind of the gentleman who made such a diagnosis, upon the fact that pressure over the growth with his finger produced distinct depressions. The descending colon was at one or two points alternately enlarged and contracted, while a marked stricture was found in the rectum due to the encroachment of the tumor already mentioned. The uterus, ovaries, and bladder were involved in the disease. There was no hereditary disease in the family as far as could be ascertained. Up to within a short time of her death the disease of the liver was not recognized.

DR. LOOMIS remarked that the natural history of cancer of the liver would explain the latter statement, inasmuch as scarcely two months are sufficient to develop the disease. He mentioned one case in which only four weeks was sufficient to bring about such a result.

DR. JOHN C. PETERS presented a résumé of the cases of tumors of the cerebrum which had been presented to the Society since its organization in 1844.

TUMOR OF LUNG AND MEDIASTINUM.

DR. JANEWAY presented a tumor of the lung and mediastinum removed from a woman aged forty-seven years, who entered Bellevue Hospital the latter part of February. Seven years before she had pneumonia of left lung, from which she recovered. At the time of her admission she had a muco-purulent sputa, from which she had been suffering for two months. She suffered from dyspnœa with slight pulsation, visible to the eye, over and to the left of sternum. There was also marked dulness or flatness over the left of sternum and left upper lobe. In addition there was bronchial breathing, whose characteristic was an element of distance, such as is obtained in pleurisy with effusion. There was a little turgescence at the base of the left lung. During the two weeks succeeding her admission she had occasional attacks of dyspnœa; pulse 100–110, temperature 100–102½° F. The physical signs remained about the same. There was an increase of half an inch in the transverse diameter of the left compared with that of the right. The diagnosis was in all probability a tumor of the mediastinum.

Glandular enlargements appeared at the root of the neck on either side, with œdema of the face and upper extremities, most marked in right. Œdema was also present in the lower extremities, but much less marked. During the last three weeks evidences of obstruction in the left lower bronchus appeared, which at first was thought to be due to the accumulation in the

pleura of that side. The heart was displaced to the right. The left chest was aspirated and ten ounces of fluid withdrawn, and a few days before death a second aspiration withdrew about six ounces of thick tenacious pus. Death was the result of exhaustion.

At the autopsy there was found at the roots of the lungs on both sides enlarged lymphatic glands. A large mass existed in the anterior, and also in the posterior mediastinum. The aorta was pushed to the right and stenosed to the diameter of the little finger. The left vena innominata was also markedly stenosed by the growth around it. The growth also permeated the lung structure surrounding the vessels and bronchi. The pericardial surface was agglutinated to the lung. The trachea and left bronchus were partially occluded by the growth. The œsophagus was displaced, but not occluded to any extent. The tumor was of the nature of lympho-sarcoma.

In answer to a question concerning abnormal heart sounds, Dr. J. replied in the negative.

A point of interest in the growth was the existence of cheesy degeneration, a condition which Virchow maintains does not exist in connection with lympho-sarcoma.

The Society then went into Executive Session.

Correspondence.

SARATOGA AS A REMEDIAL WATERING-PLACE.

To the Editor of The Medical Record.

Dear Sir:—I desire through the columns of your valuable journal to call the attention of the medical profession to abuses in the use of Saratoga waters, as well as to their medical capabilities. I have been encouraged to write my views by the interest taken in the subject by many of the leading physicians of New York City and vicinity, whom I had recently the pleasure of meeting. Their cordial sympathy with the sentiments expressed and hearty indorsement of the same were mostly based on their own experience and observation, while at Saratoga, of the indiscreet use of the mineral waters by the visitors.

I think there should be a time in a physician's professional life when he might be allowed to express his views without being charged with self-interest. After a practice at Saratoga Springs of more than thirty years—having attained a stand-point so far on the road—I feel assured that a few words of a life's experience may be honestly expressed, and trust that the charge of professional ambition will be kindly withheld.

It has been apparent to me, as to others, for several years past, that Saratoga has not sustained its deserved reputation as a remedial watering-place.

The constantly increasing accommodations made here for our guests have been responded to by the country at large, until we have now some seventy-five thousand visitors annually. Among these visitors we have many invalids who seek Saratoga for the improvement or restoration of their health. Some come from sick-beds, under the advice of their physicians; others, after long years of declining health, having sought in vain by travel and change of climate for its restoration, come here as a "dernier ressort," to drink our mineral waters; others, again, suffering from the constant pursuit of business, and from over-labor, with every form and grade of dyspepsia, and nearly all the diseases "flesh is heir to," seek here the recuperative effect of our climate and mineral waters. Theirs, being mostly functional derangements, do not respond healthfully to active treatment, or to large doses, except in rare cases, but are surely benefited by alterative and judicious quantities.

With truth, this place may be called nature's great hospital. Here are the waiting wards, clean, airy, and elegant; air that is pure and vitalizing, coming down from the Adirondack Mountains, to be warmed and rendered still more salubrious by the surrounding plains; shaded walks and quiet parks, with the life-giving fountains. Surely, nothing more is wanting but the responsible care of wise and skilful advisers, to adapt and direct the use of the different remedial agents, as contained in our springs, for the best interests of the invalids and seekers after health, who are really the patients in this great hospital. Diseases of the class usually found here carry with them greater anxiety to the patients, as well as to the physician, than any others. They are really the most difficult to treat successfully.

The mineral springs of Europe are mostly under the charge and surveillance of government. Competent physicians are officially appointed to counsel and direct those seeking to regain health by the use of the waters. Patients are carefully advised, after a thorough examination of their condition and the character of their disease, and never think of assuming the responsibility of drinking or using the waters without such advice. To do so would be at the risk of losing the opportunity of regaining their health, after a long and expensive journey. They could not afford to take such a risk, even if they had free access to the springs. Such a course would be "penny wise and pound foolish" in the extreme.

All must admit the responsible nature of the diseases met with here, the necessity of great care and discretion in their treatment, and the fact that such treatment requires a qualifying experience. No one can doubt that this is a medical trust; and that the physician must first become acquainted with the nature and character of the diseased functions, be they slight or severe, before he can properly direct a remedy. Here lies the trouble. The drinker does not take judicious counsel.

Physicians sending their patients here have usually not felt sufficient responsibility in the matter of drinking, and have only, in a very general way, advised their patients with regard to the use of our waters. Having only a limited knowledge of the efficacy of these waters, they cannot, of course, give specific directions. Some, however, who better understand the desirability of adapting the use of the waters to the various symptoms and wants of their patients, send, in each case, a statement of the condition of the patient to some local physician, and the invalid is thus consigned understandingly to professional care and discretion. But very many invalid visitors, equally needing intelligent professional advice, are yet not under the immediate care of any physician.

Another large class, not really invalids, are those who run away from home and its business cares for a stay of two or three weeks, and hope to receive benefit by using the waters. They drink indiscriminately and often injuriously. Some go to one spring and some to another, and many drink impartially from all the springs they chance to pass in the course of a morning or evening walk. Some take very large quantities, some smaller, but drink at any hour or at all hours, before or after eating, when flushed by ex-

ercise or cooled and calmed by repose, and without any intelligent or sufficient appreciation of the medicinal character and effects of the waters they are thus trifling with. If they seek advice, they ask it of the hotel porters, or the waiters, or the boarding-house keepers, or boarders in the house where they chance to be. Other visitors are consulted in the street, at the springs, and at the post-office. Hall boys and hack drivers give their advice, and are considered experts, having a rare experience with regard to quantities, claiming that thirty or forty glasses are daily taken by some of the visitors. There is absolutely no end to the absurd and ridiculous ways visitors take to get advice about the use of the waters.

Invalids need to be informed which water to drink, and how much, and at what hours; what effect they need to secure, how to obtain it, and when they have secured it. Here are twenty different springs, no two are alike in their effects, several of them are cathartic, quite a number are diuretic and tonic, and others are powerfully alterative without much cathartic effect.

Patients are told by their physicians at home to leave their business and its cares, to travel, to go to Saratoga and drink the waters for two or three weeks. They come here, and, in many instances, drink as I have stated; and among so many different springs, widely dissimilar in their medical character and effects, do not hesitate to select for themselves. In many instances of this class difficulties arise, and visitors find themselves obliged to call upon some physician for advice which they ought to have sought before drinking the water at all.

Nearly one-third of those seeking advice do so after a week or two of lost time. This is expensive. The visitor is near the end of his short stay, and is no better, and for a few days has been worse. He has not done justice to himself, to Saratoga, or to the physician. These results are unnecessary, and are falsely charged to the waters. Some of these visitors consult with physicians, who, being themselves visitors, have no particular knowledge of the use of the waters, and are too apt to meet every difficulty by ordering a discontinuance of the waters. No use is better than bad use of our waters, I admit; but these ill-advised patients are disappointed and dissatisfied, and do not carry away a correct impression of the remedial powers of our springs.

These are every-day occurrences, and this injudicious use by the visitors, particularly of our cruder waters, is sure to produce unpleasant results. In a conversation with the Rev. Theodore L. Cuyler, on this subject, he said: "I am astounded every day while at Saratoga to witness the reckless manner of drinking the water by visitors. I see them at every spring, pouring it down, with no apparent object in view but to improve every opportunity to drink."

Without doubt this imprudent and excessive use of our mineral waters is the cause of the growing disrepute of Saratoga as a remedial watering-place.

It is a fact worth repeating that our so-called tonic waters, while extremely valuable in some cases, are not generally beneficial. They cannot always be safely prescribed, even where a tonic is indicated; and, as usually taken by visitors at the springs, do very little good and a great deal of harm. The effect of the iron waters is not as a tonic to many who use them. Many find a better tonic in our alterative waters. Most invalids think they need tonics to give strength, when they really need some effect to restore functional derangements of the stomach, liver, or kidneys; and then a good appetite and refreshing sleep will tone up the system and give strength and vigor.

Of course our iron waters are sometimes used with marked success, as in cases of chlorosis and other impoverished conditions of the blood, and in chronic diarrhœa and some forms of kidney disease; but, as a beverage, as now generally used, the water is simply tolerated by the system and does but little good. People, with the idea that iron will strengthen them, drink continually of our chalybeate waters, experiencing, as the result of their imprudence, headache and febrile action, with vertigo or tightness across the forehead, followed by restless nights and a loss of appetite. There is a popular notion that if a person feels weak he needs a tonic or iron. These words have become synonyms, but erroneously so. Nothing is more weakening than iron, if not needed in the system as a remedy. Speaking in reference to this popular error, Dr. Steel says, in his "Analysis," that "it would be better for the public if the iron springs were closed during a large portion of the day."

In the use of the saline waters many seek the most active effects, and are not satisfied without the most powerful catharticisms every day. It is rarely the case that these waters can be beneficially used after eating, but they may be so used at times, as when the *prima vie* is in an acid condition and needs the neutralizing effect of the water to restore normal action. If, however, the water be taken after eating, with healthy digestion, or without an acid tendency, it would cause great gastric trouble and stop the whole process of digestion, in many cases producing violent cholera-morbus.

As alterative remedies nothing can surpass certain of our mineral waters. They readily take the place of other medicines which fret and irritate the patient by daily use. They tone up the stomach, stimulate the appetite, regulate the bowels, and produce better assimilation. While these effects are produced the blood rapidly improves in quantity and quality, and the nervous system responds to the general improvement, securing tranquillity, sleep, and general health.

These are the usual results on all persons suffering from functional diseases. Organic difficulties are benefited more by our mineral waters than by any other remedial agents, for the reason that the latter tend to prevent healthy functional action, which these waters powerfully sustain and promote.

These waters are wonderfully adapted to the wants of the human constitution. They furnish it material for its wasted and wasting tissues and energies. Take all the component parts which, by chemical analysis, are found to enter into our physical organism—the iron, lime, sulphur, potassium, silicium, sodium, phosphorus, chlorine—and compare these with the chemical ingredients of our best mineral waters. Take, if you please, Congress water. You will find that it is composed of nearly the same that is found in man; and thus the very wants of our organic natures are supplied in our mineral water from nature's own laboratory.

Who can wonder at the rapid recuperation of invalids at our springs when life itself is imbibed with every glass—the very "web and woof" of the human structure in every tumbler of mineral water? The absorption is slow, but sure; and diseased functional action is here more certain of improvement than from the use of any other medicines, or medical treatment known to the profession. I speak from my own observation and experience, and believe that when the physicians of our country become acquainted more intimately with the medical capabilities and powers of our springs, they will send their patients here with the greatest confidence in their improvement and restoration.

The question is often asked me, "Do you give medicine to those who desire to use the water?" My answer is, "No, not if I can help it." More medicine was formerly given than now. In the days of blue pills, they were always given before drinking the water. I sometimes find it better to give a mild pill to hasten the cathartic effect. Patients arrive here in the afternoon or on an evening train, and need many times a little medicine to assist the morning drink in overcoming the inactive condition of the bowels caused by travelling.

It is very important that the first effect of the mineral waters should be correct, as the kidneys are easily excited by them, and are liable by excessive action, to prevent for several days, and sometimes weeks, the cathartic effect—producing pain in the back, and headache, with muscular prostration.

Sometimes other auxiliary medicine is given, but the rule should be, "nothing but mineral water." Most patients have been medicated at home. Enough medicine can be obtained anywhere, but the object in coming to Saratoga is to try the remedial effects of mineral waters. I always understand that the physician who has sent his patient here for change of air and treatment means mineral water and nothing else. The change is slow, but radical, and the treatment decidedly constitutional and effective.

There is a wide-spread impression among the people that invalids must not go to Saratoga, or drink mineral waters, if they have any pulmonary or lung difficulties. It is thought by many that the climate is unfavorable and the spring water injurious, and that gases arise from the springs which are fatal to that class of invalids. Such is not the case. Our air is peculiarly dry and pure. We have less pulmonary disease than in healthy country towns. The only gas that rises from the water is carbonic-acid gas, which is much heavier than atmospheric air, and does not rise to the top of the tube at any time; but if it did would remain close to the ground after its escape. Some of our springs are used by this class of patients with excellent effect. The skin becomes moist, the pulse less frequent, and the febrile symptoms disappear; the cough grows less troublesome, the appetite improves, and the invalid gains flesh and strength under the alterative action of the water. The improvement has been so great in many instances that the persons benefited have desired to leave a certificate of their great improvement to aid in removing the public impression that pulmonary diseases are not benefited here.

There are many forms of dyspepsia that are entirely cured by the use of some of our springs. I have known patients who were greatly worn out and debilitated by this disease, improve every day, until wholly restored. These cures are common, and great merit may justly be claimed for the medicinal power of some of our springs in these cases.

Salt-rheum and many other cutaneous diseases are surely and speedily cured by the use of our alterative waters.

I did not intend to speak of particular diseases as benefited here. It would require too much space to enter fully into this subject, but the diseases I have mentioned are so surely cured that I feel justified in speaking of them to the exclusion of others. General directions for the use of the waters have often been given, and as often failed. The popular or cathartic effects of our waters can be readily obtained by the use of several of our springs, but with such different results that ordinary professional caution requires that the application should be as personal as the examination.

A few words in regard to Saratoga air for the people of our large cities. New York and Brooklyn, with their suburban surroundings, send as many visitors to Saratoga as all the rest of the country. The change is a natural one, and congenial to their requirements. It is not so much because Saratoga is near and easy of access, but because it is, in its natural climatic influences, adapted to their wants as an alterative and tonic. These people live near the sea-shore, with a changeable, humid atmosphere. Saratoga is inland, with a dry, pure air, filled with oxygen, coming down from the forests of neighboring mountains, and pleasantly tempered by a dry soil, with shaded streets and walks. In the city they are surrounded by malarial vapors and gases, tending more or less to vitiate the air they breathe, producing diseases of a malarial type. Saratoga is anti-malarial in all its influences and tendencies, and furnishes certain relief. The air of the city and neighborhood is humid, and often irritating to the mucous membrane of the throat and lungs, producing bronchial and catarrhal troubles. Saratoga air acts as a balm on the irritated and inflamed mucous membrane of invalids from the cities and malarial localities. One feels inclined at Saratoga to take in long inspirations, so agreeable and invigorating are the sensations; but in the city, one feels like shutting out, as much as possible, the gritty air.

Boston people are usually benefited greatly by our climate and water, and many of the clergymen of that city, with those from New York and Brooklyn, are annual visitors here. I am inclined to think we have a greater number of clergymen among our visitors than all other summer resorts combined. These need something more than the mere change of climate, something more than simple rest from labor. As a class they are sedentary in their habits, and contract severe functional diseases, and must have some constitutional treatment other than climatic influences. For this treatment the mineral waters seem peculiarly fitted.

I wish to speak of Saratoga as a place of fashionable resort, rather than as a resort for fashionable people. Her fine climate and pleasant surroundings would not alone secure to her permanency of prosperity. From Cape May to Newport rival resorts would spring up. Fashion is fickle, and can send her votaries to any place her caprices or whims may dictate. But nature has been lavish of her gifts, and has placed here her great mineral laboratory, thus lifting Saratoga above any possible competition as a merely fashionable watering-place, and placing her conspicuously before the world on her local merits—her fountains of health-giving mineral water.

The future growth and prosperity of Saratoga will be stimulated more by the use of these fountains as medicinal agents than as a fashionable resort. The place was intended by nature for a quiet place. The first effect of the water, so grateful to the invalid, is to insure sleep and repose. People leave business cares at home, and come here to forget them; they learn to sit still; they do not walk, but saunter; and they sleep at all hours of the day, and all night, until they are completely and perfectly rested. Their digestion is good, and they feel quite at ease with the whole world. These are some of the primitive effects of drinking our mineral waters, and are the foundation-stones of the healthful structure to be built up here. This restored quiet means a great deal, and is difficult to attain by ordinary remedial agents. Insomnia has no dwelling place at Saratoga, and cerebral hyperæmia takes its flight.

L. E. Whiting, M.D.

Saratoga Springs, N. Y.

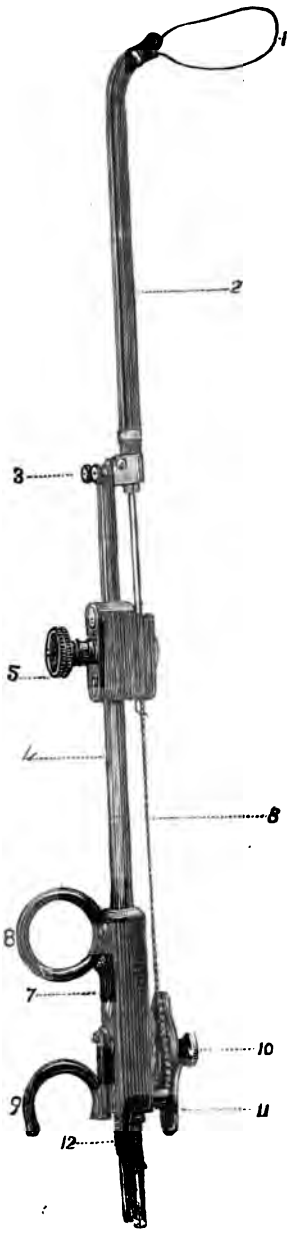
New Instruments.

A NEW GALVANO-CAUSTIC ÉCRASEUR.

By LOUIS F. SASS, M.D.,

NEW YORK CITY.

This instrument, devised by me, will, I believe, be found to possess many advantages over similar ones heretofore in use. The objects aimed at have been strength, simplicity, neatness in appearance, and applicability to the wants of general practitioners.



JOHN REYNDER & CO.

Fig. 1.

JOHN REYNDER & CO

Fig. 2.

For facility of description I shall present a front and a profile view of the same, the instrument itself being just twice the size of the accompanying cuts.

Fig. 1 shows side view. (1) is a platinum wire loop passing through the tubular bars (2), these being covered with English elastic bougies so as to insulate the metal, and to protect them from coming in contact with the flesh. (3) are two screws which firmly connect the tubular bars or anterior half of the electrode with the main part (4), and the handle (7). The bars (2) can be removed by loosening the screws (3), and the handle then used to insert any of the active cautery knives, and thus obviating the additional use of a handle for the same. (5) is a rubber sliding vise which has on its under surface a brass screw by means of which the vise can be relaxed or tightened with the greatest facility so as to grasp the free ends of the loop, and thus by a single turn of the screw the wire is securely clamped. (6) is the chain made on the principle of the écraseur chain used in surgery; one end of this chain is attached to the vise, the other end winds over the cog-wheel (10). (7) represents the handle of the instrument, made of vulcanized rubber, and presenting on its under surface a brass ring (8), through which the index-finger is introduced; also a half ring (9), for the purpose of holding the instrument and connecting or interrupting the current with the thumb of the same hand, the latter being accomplished by means of the spiral spring (12); thus when the pressure is brought to bear on the half ring (9) is relaxed, the spiral spring, acting by its elasticity, will separate the lower from the upper part of the electrode on the right side, inside of the rubber handle; the circuit is thus made and broken with the greatest facility.

Fig. 2 shows front view of the instrument. On the upper surface of the handle in this figure will be seen the cog-wheel over whose cylinder the chain winds, and thus effecting the contraction of the loop, also the finger-pieces (10) by which the wheel is rotated, the stopper or click (11) which prevents the backward rotation of the wheel, and consequently the loosening of the loop. The cog-wheel (10), or stopper (11), spring interrupter (12), the pole connections (13 and 14), the superior horizontal bars (2), and the small pulley-wheels (*a*) can be seen to better advantage in Fig. 2.

The mechanism of the instrument is exceedingly simple. The wire being passed through the tubular bars (2), its lower ends secured in the vise (5), and the loop adjusted around the part to be extirpated, the electrode is then connected with the battery, the current connection established by gently pushing with the thumb the half ring (9). The cog-wheel is then rotated with the finger of the disengaged hand until the loop has contracted sufficiently to burn through and effect the extirpation of the growth or part to be removed. A glance at the illustration will show how the winding of the chain around the cylinder of the cog-wheel pulls the vise backwards, and this in its turn the wire loop whose end it holds. The cog-wheel revolves with a clicking sound, each click denoting the contraction of the loop one-sixteenth of an inch in its diameter.

The advantages I claim for this instrument, without dwelling upon the great ease with which it is worked, or the neatness and elegance of its construction, are:

1. It is constructed in such a manner as to present on its upper surface no obstruction to the eye of the operator, a desideratum greatly to be appreciated when operating in cavities, as the vagina, uterus, rectum, etc.

2. The small pulley-wheels (*a*) Fig. 2, over which

the loop glides, greatly facilitates its retraction, thus preventing heavy friction and jagging, which naturally would result in the irregular or jerking contractions of the loop, and thereby greatly increasing the danger of hemorrhage, which may be avoided if the wire is contracted slow and gradually. As the great end which we seek to obtain in the use of the galvano-caustic écraseur, as well as with the wire écraseur, is the avoidance of hemorrhage, I claim this as one of its most valuable properties.

3. Both ends of the wire are firmly secured by one single screw, which saves a great deal of unnecessary delay in adjusting, and constitutes a safeguard against the possibility of one of the ends getting loose.

4. The mechanism of contracting the loop by the winding of the chain around the cog-wheel places the instrument always under the control of the operator, who can cut through the tissues with the heated loop as rapidly or slowly as he pleases, and as each clicking sound of the wheel indicates the exact progress made, this will enable him to allow the necessary time for coagulation of the blood, hereby effecually preventing the occurrence of hemorrhage.

In a number of extirpations of hemorrhoids, fibromas, and protruding erectile tumors, this instrument has in every respect served the purpose for which I designed it, and the security which it affords against hemorrhage will, I think, render it exceedingly valuable for extirpations of the tongue and of deep-lying tumors.

73 W. 36TH STREET.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from June 16 to June 22, 1878.

TOWN, F. L., Major and Surgeon. Granted leave of absence for eight months, with permission to go beyond sea. S. O. 128, A. G. O., June 13, 1878.

TREMAINE, W. S., Capt. and Asst. Surgeon. Leave of absence extended one month. S. O. 47, Div. of the Missouri, June 14, 1878.

BENTLEY, E., Capt. and Asst. Surgeon. Granted leave of absence for one month. S. O. 74, Dept. of the Gulf, June 12, 1878.

TAYLOR, M. K., Capt. and Asst. Surgeon. Granted leave of absence for one month from July 1st, with permission to apply for four months' extension, and to go beyond sea. S. O. 123, Dept. of Texas, June 13, 1878.

HEIZMANN, C. L., Capt. and Asst. Surgeon. To proceed by C. P. R. on 10th inst. to Elko, Nev., and on arrival, report to Capt. Thomas Byrne, 12th Infy., for duty with his command. S. O. 82, Div. of the Pacific, and Dept. of California, June 8, 1878.

GIRARD, A. C., Capt. and Asst. Surgeon. When relieved by Asst. Surgeon Crampton, to proceed to Fort Keogh, Mont., and report to the Post Commander for duty. S. O. 72, Dept. of Dakota, June 14, 1878.

HALL, J. D., Capt. and Asst. Surgeon. Assigned to duty as Post Surgeon at Fort Stockton, Texas. S. O. 124, Dept. of Texas, June 14, 1878.

MERRILL, J. C., 1st Lieut. and Asst. Surgeon. Granted leave of absence for one month on Surgeon's certificate of disability, with permission to leave limits of Department. S. O. 126, Dept. of Texas, June 17, 1878.

HALL, W. R., 1st Lieut. and Asst. Surgeon. To accompany the troops leaving Fort Canby June 4th, for field service. S. O. 65, Dept. of the Columbia, June 3, 1878.

CRAMPTON, L. W. 1st Lieut. and Asst. Surgeon. Assigned to duty at Fort Randall, D. T. S. O. 72, C. S., Dept. of Dakota.

SPENCER, W. G., 1st. Lieut. and Asst. Surgeon. Relieved from duty at Fort Townsend, to proceed to Fort Boise or vicinity, and report to the chief Medical officer on duty with troops in the field. S. O. 65, C. S., Dept. of the Columbia.

Having passed a satisfactory examination before the Army Medical Board, in session in New York City, the following medical gentlemen have been appointed by the President Assistant Surgeons, U. S. Army, to date from June 6, 1878, and confirmed by the Senate: Victor Biart, W. W. Gray, Louis Brechemin, and Louis A. La Garde.

DR. WILLIAM E. HALL died at the residence of his father, Gen. James F. Hall, at Tarrytown, N. Y., at the early age of 33. He was a graduate of the College of Physicians and Surgeons of the class of 1870, and served as an *interne* at Charity Hospital. He was a Curator to that institution from 1871 to 1875, when he was obliged to resign on account of failing health. He was for four years a member of the Board of Health of New York City. The conscientious painstaking and zeal with which he discharged his duties as Health Inspector, Curator to Charity Hospital, Surgeon to the Bureau of Medical and Surgical Relief for Out-door Poor, Private Instructor in Anatomy and Surgery, together with the cares of an increasing private practice, are believed to have hastened the development of the disease which terminated his life. During the war he served in the Department of the South on the respective staffs of Generals Turner, Foster, Gilmore, and Hatch, and it is a remarkable incident that at the same time his father and grandfather were in the field, making three generations represented in the Union army at the same time. As a physician he was in no ordinary degree conscientious and self-sacrificing, and his ability and acquirements seemed to promise for him a high rank among his fellows. The early closing of a career that promised so great usefulness is truly sad, but the bright example of his Christian life, and earnest devotion to his duties, cannot fail to bear much fruit, and he has left to his friends a rich legacy of precious memories.

DR. BROWN-SÉQUARD.—The *Gazette Médicale* of Paris does not favor the candidature of Dr. Brown-Séquard for the Chair of Medicine in the Collége de France, which was left vacant by the death of Claude

Bernard. It argues that M. Brown-Séquard is too much of a traveller; that he is too fond of change of place and of nationality, while stability is a first essential in a savant charged with instruction in one of the higher branches of science. It asserts that M. Charcot would be the most acceptable successor to Claude Bernard, although his appointment would necessarily involve a departure from the paths of investigation and instruction followed by the great physiologist and his predecessor, Magendie.

The Paris International Congress of Hygiene will meet in the middle of August.

Treatment of Sore Nipples.—Dr. Haussmann, of Berlin, recommends very highly the use of lotions containing five per cent. of carbolic acid, in the treatment of erosions of the nipples. He claims that the carbolic acid not only cauterizes superficially the eroded spot, but that it penetrates into the openings of the smallest lymph-vessels which have been laid bare by the erosion, and destroys at once any parasitic germs or infectious organic substances that have been conveyed to the nipple by the mouth of the child or the hands of the physician or nurse, or of the woman herself. In so doing it prevents the development of almost all inflammations of the mammary gland itself. Of course the nipple must be carefully cleansed every time the child is put to the breast.—*Centralblatt für Gynäk.*, No. 10.

Treatment of Blennorrhagic Conjunctivitis.—Prof. Gosselin, of Paris, treats his cases of blennorrhagic conjunctivitis, when seen before suppuration of the cornea has set in, by instillations of alcohol. He first cleanses the surface of the conjunctiva by injecting a stream of cold water, with moderate force, under the eyelids, and then instils into the eye a few drops of a mixture containing one part of alcohol at 90° and four parts water. This process is repeated every three hours. In the intervals the eye is kept constantly covered with compresses wrung out of cold water, and is frequently washed with the same. When the suppuration is very free the injections of cold water under the eyelids may be repeated oftener than every three hours. Prof. Gosselin believes that this treatment arrests the suppuration more rapidly than any other, and it has, at all events, proved the most successful in his hands. The power of alcohol to moderate and even prevent suppurative inflammation has been well demonstrated, and he uses it not only in cases of suppurative conjunctivitis, but also in the treatment of wounds, whenever they are sufficiently superficial to permit him to hope that they can be made to heal without suppuration. In dressing wounds of the head in particular, he always uses alcohol. After the suppurative process in the conjunctiva has ceased, the chemosis sometimes persists, and may require incision, or even excision. A prolonged course of treatment with nitrate of silver or sulphate of copper may also be necessary to prevent the formation of granulations in the conjunctiva.—*Receuil d'ophthalmologie*, April.

Treatment of Chronic Pharyngitis.—Prof. Pippingsköld, of Helsingfors, treats pharyngeal catarrh by gargling morning and evening with water at a temperature of from 59° to 68° F. About two tumblers of water must be used on each occasion, and the gargling must be continued for several months, and perhaps even for an entire year, or, if left off sooner, must be recommenced as soon as the symptoms of catarrh become troublesome. The Professor claims that the water, when used at the above temperature, lessens the hyperæmia, and restores the tone to the vessels of the soft palate; ice-cold water, on the other hand, would cool the parts more for a time, but it would excite reaction with increased hyperæmia, and might easily do more harm than good. The treatment has also proved useful in cases of granular pharyngitis.—*Allg. Med. Cent. Zeit.*, April 20th.

Color-Blindness in School-Children. — Since November of last year Prof. Cohn and Dr. Magnus have examined 5,079 school-children in Breslau, Germany, for color-blindness. Out of 2,761 boys, they found 76, or 2.7 per cent., who were undoubtedly color-blind, and out of 2,318 girls only one, or 0.04 per cent. The percentage of Jewish children, who were affected with color-blindness, was twice as great as that of Christian children. The examinations were conducted with great care and thoroughness, so that the above figures may be regarded as thoroughly reliable. Two facts, which are, at all events, worthy of note, may be deduced from them, viz., that color-blindness is exceedingly rare among girls, and that the affection is much more common among Jews than among Christians.

Secret Remedies.—It seems that even aristocratic personages are not averse to turning an honest penny by the manufacture and sale of secret remedies, the latest addition to the great army of proprietors of such remedies being no less a person than the Grand-duchess of Mecklenburg-Schwerin. That noble benefactress of her race advertises a powder which is claimed to be a sovereign remedy against the convulsions of childhood. As a convincing proof of its efficacy, the vulgar are informed that the powder once cured her Excellency's aunt of severe convulsions. One of our German contemporaries mildly suggests to the lady the propriety of having the powder analyzed, and given to physicians for trial. We hope, for the sake of our belief in educated women, that the suggestion will be acted on at once.

Treatment of Intertrigo in Children. — Dr. Wertheimber recommends the external use of a solution of corrosive sublimate (gr. i. to ʒ iijss. water) for the intertrigo of children, and asserts that it is the most effective of all the remedies recommended for that affection. The affected spots are covered with pieces of lint soaked in the solution. Sometimes it is sufficient to keep these compresses on for an hour at a time, three or four times a day. The curative action is very rapid, the redness and exudation often disappearing in 24 to 36 hours. General symptoms, due to the absorption of the drug, have never been observed by Dr. Wertheimber; the danger of absorption is not great, as the applications do not, as a rule, need to be continued more than a few days. When the improvement is pretty well advanced, dyachylon ointment may be substituted for the solution.—*Berliner klin. Wochenschrift*, No. 15.

Treatment of Intestinal Invagination by Electricity.—Dr. Bucquoy has reported three cases of intestinal invagination that were cured by electricity. This method of treatment was recommended some time ago by Lervy (d'Étoiles) and others, but it has seldom been put in practice. Dr. Bucquoy used the interrupted current in his cases; an olivary rheophore was introduced into the rectum, and a moist rheophore held on the abdomen, so that the current acted both on the intestinal and the abdominal walls—principally, perhaps, on the latter. Each séance lasted about ten minutes. The treatment is not painful, even to children, provided the currents used at first be very

weak and the abdominal rheophore be applied lightly. It must be begun, however, before inflammation has set in. The bowels do not always move immediately after the application of electricity, an enema or purgative being sometimes required to complete the treatment. Dr. Bucquoy also employs other methods of treatment, such as ice to the abdomen, simple enemas, excessive distention of the gut, etc., as adjuvants to the treatment by electricity.—*La France Médicale*, April 17th.

Vomiting in Pregnancy.—Dr. Lubelski, of Varsovia, reported a few years ago some cases of chorea that were rapidly cured by the ether-spray, and the treatment has since been tried with equal success by other physicians. Dr. Lubelski now employs the ether-spray also in the treatment of obstinate vomiting during pregnancy. He directs the spray to be applied to the epigastric region and the corresponding portion of the vertebral column; it should be continued from three to five minutes, or even longer, if well borne, and be repeated every three hours. In rebellious cases he advises an alternation of chloroform and ether-spray. He begins the treatment as soon as vomiting, or even nausea, makes its appearance. M. Dujardin-Beaumetz has recently reported a case of obstinate vomiting in the second month of pregnancy that was cured by this treatment. The patient was unable to retain anything at all on her stomach, although all the usual remedies had been tried. Finally, the ether-spray was resorted to; it was used five minutes before each repast, and was directed against the middle of the back and the middle of the stomach. Richardson's apparatus was used. The vomiting stopped almost immediately and did not return when the treatment was suspended, eight days afterwards.—*Gazette des Hôpitaux*, April 20th.

A Baby Opium-Eater.—Dr. Little, of this city, reports the case of an infant suffering from suppurative inflammation of the knee-joint, who, when under eight months of age, took on one occasion two ounces (℥ ij.) of Magendie's solution of morphine in twenty-four hours—one and a half ounce of this quantity was taken within twelve hours. The child had been an opium-eater from the time it was three weeks old; the inflammation of the knee-joint set in at that time, and the mother commenced to administer small doses of paregoric to relieve the pain. The daily dose of morphine has been gradually reduced since the day when the two ounces were taken, and at the time Dr. Little's statement of the case was written the child was getting only ten drops of Magendie's solution at bed-time. —*Am. Journal Obstet.*, April.

Treatment of Pityriasis Versicolor. — Prof. Hardy treats this affection with sulphur-baths, or frictions, several times a day, with the following ointment: ℞. Axungire, ℥ i.; sulphur, ʒ ss.; acidi nitrici, gtt. x. ℥. Internally he gives mineral waters if the case be a severe one, and follows them up with Fowler's or Pearson's solution of arsenic, in doses progressively increasing from three to ten drops. The drops are taken before each meal in a glass of wine and water.

Dr. Besnier, of the Hôpital Saint Louis, Paris, gives the preference to sublimate baths, or, where these cannot be used, to frictions with a soap containing pumice-stone, followed by lotions with a solution of corrosive sublimate, gr. iv. to ℥ iv. distilled water. Where it is not considered safe to leave so poisonous a mixture in the hands of the patient, Dr. Besnier substitutes the following simple treatment: Lotions with soft-soap, followed by three applications of an ointment containing ʒ ss. of Turpeth mineral to the ounce of lard. In one of his patients, whose entire chest and back were covered with the patches of pityriasis, a cure was produced by two lotions and only two frictions.—*Lyon Médical*, May 5th.

Two Cases of Strangulated Hernia Treated by Ergotine.—The first case was one of recent hernia in the right groin. The tumor was about as large as a chestnut, hard, and too sensitive to permit of the slightest attempt at taxis. The skin over the tumor was washed with warm water containing an alkali, to render absorption more easy, and pure ergotine was then rubbed into it every two hours. At the same time a tablespoonful of a solution consisting of grs. lxxv. of ergotine in ℥ iv. of vehicle was administered every hour. About five hours after the treatment was commenced the vomiting and colicky pains began to abate, and the tumor became less sensitive, and twelve hours later the hernia returned spontaneously.

In the second case, several unsuccessful attempts had been made to return the hernia by taxis, and leeches and the ether-spray had also been employed in vain. Finally, as the case was becoming desperate and inflammation was threatening, it was decided to try the ergotine treatment as a last resort before having recourse to operation. The treatment was carried out exactly as in the above case. It was begun at three o'clock in the afternoon, and at six o'clock on the following morning all the symptoms were relieved and the tumor was reduced with the greatest facility. —*Le Bordeaux Médical*, April 30th.

Treatment of Tinea Favosa.—Dr. Viger reports two cases of tinea favosa that were cured by external applications of the oil of cade. In both cases almost the entire head was covered with thick coats of favus. The local treatment was as follows: The head was washed morning and evening with soap and water, after which it was anointed with oil of cade, and then covered with a cap of oiled silk in such a manner as to prevent the admission of air. Internally, cod-liver oil and a nourishing diet were prescribed. Under this treatment the crusts rapidly disappeared, and both the patients were discharged cured, after two months of treatment. One of these cases was treated eighteen months ago, and the other six months ago, and neither of them have as yet shown any symptoms of a relapse.—*L'année Médicale*, April.

Phthisis in Victoria.—From a special report prepared by a committee of the Victoria (Australia) Medical Society, it appears that the mortality from phthisis in that colony is but little more than half that of England from the same cause, has grown perceptibly less of late years, and is especially low among persons under fifteen or twenty years of age. The annual mortality per 10,000 in England and Wales, from 1860 to 1864, from diseases of the respiratory system, was 34.09; from 1870 to 1874, inclusive, 36.14. From phthisis alone, from 1860 to 1864, the yearly rate per 10,000 was 25.66, while from 1870 to 1874 it was only 22.83, showing an increase in respiratory diseases, but a decrease in phthisis. In Victoria, from 1860 to 1864, respiratory diseases destroyed yearly 15.90 per 10,000; from 1870 to 1874, only 14.82. Phthisis, during the first four years of the last decade, presented an annual mortality of 13.08; during the first four years of the present decade, 12.60; showing a slight decrease in both during the ten intervening years.

HYPODERMIC INJECTIONS OF ERGOT.—Labarde says that the nearer the hypodermic injection is to the part it is desired to affect, the quicker will be the result, and Delore, for the same reason, injects ergotine in the tissues of the uterus for fibrous tumors of that orgar.

MATERIA MEDICA OF THE HINDUS.—A reviewer of Udoy Chand Dutt's "Materia Medica of the Hindus" gives, in a recent number of *The Doctor*, the following interesting summary:

"Aconite is used in fevers and other diseases; the power of this poison is highly developed in the varieties grown in hot climates. Opium, now so important a product of India, is not mentioned by the ancient Sanskrit writers, and was probably introduced by the Mussulmans, its name being derived from the Arabic. Its use seems to be more understood than that of many drugs. Ægle marmelos is widely used as a medicine, and has attracted some attention in Europe. The Bela tree is always found near the temples of Siva, to whom it is sacred, the leaves being used in the ceremonies. The unripe fruit, the dried pulp, the juice of the leaves, decoction of the root, etc., are employed, and the plant seems adapted for the treatment of disorders endemic to the climate, as is attested by Anglo-Indians. Mucuna pruriens has a peculiar reputation, and it is conjectured that the English name cowhage may be from the Hindu *Kiwach*. Cassia is indigenous, and the beautiful *cassia fistula* tree obtains in Sanskrit a name signifying 'King of Trees.' The cassia sophora is called *Kásamanda*, or destroyer of coughs, and prescribed for that purpose; but the author does not find it is much used for this at the present day. The tamarind is found throughout India, and its properties were known in early times. The Arabians derived their knowledge of it from the Hindus, and named it *Tamare-hindi*, from which our word seems to have been taken. Catechu, as an ingredient of the betel-leaf chewed by the natives, is of course well known, and its astringent action is understood and utilized in diarrhœa. It is also used in diseases of the mouth and in skin diseases. The large Indian gourd eaten in curries is also thought to be a specific for hæmoptysis, but the older books do not mention this property. There is a prickly shrub of the euphorbium kind, which is sacred to the goddess of serpents, but of which the Hindus use the milky juice, not only externally but internally, giving it with other medicines as a drastic. Externally it is rubefacient. Indian hemp is used as *bhang* and in other forms for its intoxicating effects, and sometimes as a medicine. The author tells us that some castes among the up-countrymen and some Bengalese do not use any narcotic, but that the ordinary run of orthodox Hindus, accustomed to their little excitements, use *bhang* without incurring the opprobrium that would result if they resorted to alcohol. Sugar is largely used in Hindu medicine; the cane and the manufacture were known from early times. The Sanskrit, named *Sarkara*, in Arabic became sakkar, and in Latin, the familiar saccharum; candy, too, can be traced back through the Arabic *kand* to the Sanskrit *khanda*. This part of the book closes with the products of fermentation, of which many are mentioned. The animal materia medica is less attractive. Leeches were known at a remote period. Eight sorts of honey are described by Susruta, and wax is used for ointments. Serpent-poison has only been used in recent times, but musk has long been known. The properties of the milk of various animals have been described in great detail by Sanskrit writers. All, except human milk, are advised to be taken boiled. Buttermilk, whey, butter, etc., are also described. Bile is used as a laxative. The urine of various animals, especially the cow, is minutely described, and used in anasarca, urinary diseases, colic, jaundice, leprosy, etc. The properties of the flesh of various animals are also distinguished. With regard to the prescriptions, we observe they are characterized by that complexity which has always marked medicine, save in its latest stage."

WRITERS' CRAMP.—A paper on "Writers' Cramp and Impaired Writing Power," recently read before the Royal Medical Society by Dr. Vivian Poore, supplements his important series of articles contributed to the *Practitioner* in 1878, with further observations. He classifies his cases into six groups, thus: paralytic, six cases; spasmodic, five cases; degenerative, nine cases; neuralgic or neuritic, nineteen cases; proper writers' cramp, thirty-two cases; anomalous, four. His conclusion from all the cases cited is, that writers' cramp is a disease of insufficient muscular co-ordination, but he dissents from the hypothesis of a special nervous centre controlling and co-ordinating the muscles in writing, because (1) he has never observed a case without evidences of peripheral alteration, and because there is, as a rule, no evidence of alteration in any other quarter; because (2) writers' cramp is never suddenly established as aphasia often is; because (3) if there is such a co-ordinating centre, it is the first instance on record of a nervous centre created by education in a special series of movements. Dr. Poore inclines to the opinion that the disease is essentially neuralgic. M. Gallard, on the other hand, in his just published volume, "Clinique Médicale de la Pitié," brings forward a large number of cases tending to show that the disease evades any anatomical localization whatever, that fatigue is far from being one of its essential causes, and that it is a purely functional disturbance, common to engravers, artificial flower manufacturers, pianists, violinists and telegraph operators, as well as writers. An American observer finds it most prevalent among persons who use glazed papers, such as foolscap, in writing, and, from analysis of extract of such paper, after boiling thoroughly, suggests that in many instances the disturbance probably has its origin in the local absorption of the lead or arsenic employed in the manufacture.

INSANITY IN ITS LEGAL RELATIONS.—Dr. John Charles Bucknill, in referring to Lord Coke's ancient classification of insanity, said: "Like all kinds of insanity which have any interest for lawyers, it is based upon mental qualities and conditions, and not upon the physical substratum. It is this point which, more than any other, we are bound always to bear in mind in the consideration of the diagnosis of insanity for legal purposes. In courts of law the diagnosis refers entirely, not to the existence of bodily disease which is the cause of insanity, but to the product of that disease."

He denied the statement of lawyers that medical men considered insanity a disease. He considered it the result of diseased conditions, and while he admitted that insanity, as a legal fact, was the only proper subject of legal inquiry, still, as it has been shown that a diseased condition of the body had been proved in a number of instances to be the cause and condition of the fact of insanity, the connection must be held to exist. In that case the fact of insanity could not be considered without reference, tacit or expressed, to the fact of bodily disease which underlies it.

The question of homicidal insanity is fully discussed. He doubts the existence of impulsive insanity to kill, as a specific form of insanity, in which there are no other symptoms of mental disease, and adds: "The conclusion, therefore, to which we must come is, that homicidal insanity—the impulsive insanity to kill—is either due to imperfect observation, which has failed to detect real derangement, or to a mistaken estimate of a real criminal."

CONGENITAL ABSENCE OF ONE KIDNEY.—In the current number of Virchow's *Archiv*, Dr. Beumer has collelcted from various sources forty-eight cases of this interesting malformation. In forty-four cases it was entirely absent, and in the other four rudimentary. It was as often absent on one side as the other. It was of more frequent occurrence in the male than the female. In most cases in which the kidney was absent the suprarenal body was present; in two cases it was enlarged, in five cases it was absent. In thirteen cases an arrest of development of the sexual organs was observed.

The remaining kidney was in all cases enlarged and increased in size and weight, and a corresponding development of the vessels and ureter.

This is a fresh and striking proof of the completeness with which the one kidney can carry on the functions of two without suffering degeneration in consequence of the increased work.

SALICINE IN RHEUMATIC FEVER.—Dr. John Martin, senior medical attendant of the Belfast Dispensary, reports six cases of rheumatic fever, successfully treated with ten grains of salicine every third hour. The treatment had to be continued from five to ten days, and was followed by a tonic regimen of quinine and iron in each case. He regards salicine as a potent factor in the prevention of rheumatic palsy, and of cardiac complications, and attributes its potency to a direct action upon the rheumatic poison, by which it is decomposed and eliminated from the system.

CEREBRAL LOCALIZATION AND AMPUTATION OF EXTREMITIES.—A case of amputation of the right thigh at the age of nineteen, followed by atrophy of the fold passing from the second left frontal convolution to the anterior marginal one, is reported by Drs. Le Double and Viollet, of Tours. The patient died of tubercular pleurisy thirty-one years after the operation. The general appearance of the brain upon autopsy was found to be symmetrical with equal lobes, with exception of a very evident depression of the membranes in front of the anterior marginal convolution, which became more apparent on the removal of these envelopes. The left anterior marginal convolution had the same volume as the right, but the fold passing from it to the second convolution presented all the usual phenomena of atrophy. As the case was one bearing upon the disputed issue of cerebral localization, the reporters took the trouble to collate analogous cases, of which they found seven on record. In the first, amputation of the left arm had been followed, in the course of five years, by atrophy of the superior portion of the ascending convolution of the paracental lobule. In the second, amputation of the thigh had involved atrophy of a cerebral lobe and corresponding marginal convolutions, in the course of thirty years. In the third, amputation of the thigh having been performed, the patient died nine months later of purulent infection, and no atrophy had yet taken place. M. Luys reported three cases of his own to the Academy of Medicine, France, in October, 1877, in which amputation of the leg had been followed by atrophy of the upper part of an ascending frontal convolution. The seventh case was one of arrested development of the leg, reported by M. Laudouzy, in which the atrophy involved the superior part of the ascending parietal convolution. Analysis of these cases shows that the lesion occupied a point near the motor centre proposed for leg by Curville, Duret, and Ferrier, in only one of them.

STIMULANTS IN TYPHOID FEVER.—In a recent clinical lecture, Prof. Pepper, of the University of Pennsylvania, has some observations upon the contested issue whether stimulation is valuable in cases of typhoid fever. "Stimulants," he is of the opinion, "are, as a general rule, only needed in the case of an elderly person, or to meet certain indications, such as (1) ataxic nervous disturbances, sleeplessness, muscular spasms, maniacal delirium; (2) circulatory disturbances, feeble and rapid pulse, and feeble development of the first sound of the heart; (3) profound asthenia, as shown by great tremulousness, inability to make any movement, and tendency to slide downward off the pillow; (4) dry and brown tongue, sordes on the lips, teeth, and tongue." In using stimulants, he recommends to begin with the milder forms, such as wine whey, made in the proportion of one part sherry to three parts milk, from a gill to a half-pint to be given in the course of three hours. He prefers to give whiskey in lime-water and milk, in the proportion of one tablespoonful of each of the former to three ounces of the latter. Half an ounce of whiskey per hour he regards as the maximum dose.

HYPODERMIC INJECTIONS OF CHLOROFORM.—These injections have been highly recommended by eminent physicians as a substitute for morphine. It is claimed that they are painless, that they relieve pain rapidly and for several hours, and that they are entirely innocuous, being followed by neither local nor general symptoms. Dr. Jochheim, of Darmstadt, however, reports a case in which the injection of only ten drops of chloroform, which is only half what is frequently administered, was followed by severe local disturbances. Five hours after the injection a violent local inflammation set in, and in twenty-four hours a hard, black slough had formed, which was not cast off by suppuration until six weeks afterwards.—*Allg. Med. Cent. Zeit.*

ANNUAL MORTALITY.—The annual death-rate per 1,000 persons living, of the estimated or enumerated population, according to the most recent weekly returns of Philadelphia, was 18.15; Brooklyn, 22.8; St. Louis, 8.67; Chicago, 13.23; Baltimore, 16.70; Boston, 16.19; Cincinnati, 13.22; New Orleans, 23.77; Cleveland, 12.19; Richmond, 15.43; Charleston, 43.55; Dayton, 9.83; Lowell, 11.81; Worcester, 13.04; Cambridge, 14.31; Fall River, 20.39; Lawrence, 24.62; Lynn, 9.48; Springfield, 13.24. Monthly returns, San Francisco, 17; Detroit, Mich., 10.56; Selma, 30.43; Wilmington, Del., 17.7. Foreign cities—weekly returns: London, 22.5; Liverpool, 25.1; Birmingham, 24.1; Manchester, 20.9; Glasgow, 27.5; Edinburgh, 29.2; Dundee, 20.3; Dublin, 32.1; Belfast, 34; Cork, 20; Brussels, 23.4; Antwerp, 26.3; Ghent, 22.6; Buda-Pesth, 46.9; Paris, 25.2; Rome, 18.2; Turin, 27; Venice, 29.1; Berlin, 28.5; Munich, 38; Breslau, 37.39; Vienna, 31.5; Copenhagen, 22.59; Stockholm, 23.7; Christiana, 21.87; Amsterdam, 28.5; Rotterdam, 33.1; The Hague, 26; Calcutta, 48.5; Bombay, 44.3; Madras, 43.5; Geneva (with suburbs), 26.5; Basel, 29.3; Bern, 31.7; Warsaw, 35.3; St. Petersburg, 60.87—monthly returns—Trieste, 44.2.

Brown, Dr. S. A. (U. S. N.), remedy for poison oak, ivy, and sumach, 320.
Broad ligament, cyst of, 385.
Bromide of potassium in puerperal convulsions, 428.
Bromides and chloral in epilepsy, 177.

Bromidrosis, treatment of, 359.
Bronchial casts, expectorated, 433.
Bronchitis, fibrinous, 504.
Bronchus, shawl-pin in, for thirty-three days—removal, 129.
Brown-Séquard, Dr. C. E., lectures on diseases of the nervous system, 41.
Bulkley, Dr. L. D., case of unrecognized fatal hemorrhagic small-pox, 325.
Bull, Dr. W. T., fracture of femur, 17; post-tracheal abscess, 236; thymol as an antiseptic, 299; wound of abdomen, etc., 428.
Burnett, Dr. Charles H., notice of work by, 35.
Butter, adulteration of, 31; artificial, 489.
Button removed from trachea three years after its lodgement, 396.

C.

California, report of health board of, 153.
Cannabis indica, eruption induced by, 364.
Carbolic acid, objections to in treatment of piles, 109.
Carbolized ligatures, new use for, 497.
Carden's amputation, case of, 16.
Cardiac enlargement and respiration, 30.
Caro, Dr. S., effects of narcotics in fœtus, 435.
Carpenter, Dr. Wesley M., treatment of abortion, 338.
Carroll, Dr. A. L., retroflexion pessary, 259.
Carotid pulse, retardation of, 409.
Caruncle of female urethra, 246.
Cary, Dr. Charles, symmetrical osteo-myelitis, 109.
Caswell, Dr. E. T., fracture of eighth dorsal vertebræ, 407.
Catgut ligature, reliability of, 16.
Centrum ovale, disease of, and paralysis, 85.
Cerebellum, glioma of, 234; paralysis and disease of, 81.
Cerebral diseases, localization of, 321, 341; localization, 520; localization, contributions to the study of, 249; tumor, 201.
Certificates in the daily papers, 55, 72, 93, 99.
Cervix uteri, elongated and labor, 129.
Cervix uteri, laceration of, as a factor in certain uterine diseases, 193.
Cess-pool fever, 303.
Chambers Street Hospital (N. Y.), reports of, 428.
Chancroid, wash for, 88.
Charteris, Dr. M., notice of work by, 371.
Chase, Dr. Walter B., laceration of cervix uteri and uterine disease, 193.
Children's Hospital of District of Columbia, 200.
Chimpanzee, dissection of brain of, 212.
Chinese, materia medica among the, 216.
Chloral and bromides in epilepsy, 177.
Chloral hydrate as antiseptic, 340.
Chlorate potash in catarrh of bladder, 420; danger of large doses of, 397.
Chloride of potassium in epilepsy, 451.
Chloroform, hypodermic injections of, 520; narcosis cured by nitrite of amyl, 420; death from, 180; and dentistry, 291.
Cholera infantum, treatment of, 413, 485.
Cholera in Japan, 99.
Choroiditis metastatic, 144.
Church hygiene, 250.
Cinchona bases compared with quinia, 266.
Claude-Bernard, death of, 269, 300, 360.
Clark, Dr. Alonzo, lectures on typhoid fever, 261, 283, 301.
Clavicle, dislocation of, 429.
Club-foot, treatment of, 487.
Cochlea, injury of, from cannonading, 146.
Cocoa-butter for fever heat, 455.
Cod-liver oil, substitute for, 289.
Colitis, traumatic, 15.
Columbia Hospital controversy, 132.
College Physicians and Surgeons Alumni Association, 358; commencement, 199.
Color blindness, remarks on, 452; blindness in school children, 517.
Comegys, Dr. C. G., diarrhœa in children, 485.
Comegys, Dr. W. H., facial paralysis, 226.
Comstock, Dr. L. L., myxomatous tumor of buttocks, 7.
Conjunctivitis, blenorrhagic, treatment of, 516.
Connecticut Medical Society, 509.
Constipation, habitual, in females, 68.
Contagion, spread of, by books, 152.
Convulsions associated with brain diseases, 143; cause of, 164.
Coroner's bill, 192.
Cotton-wool in ear diseases, 168; as surgical dressing, 318.
Cough, chronic, treatment of, 417.
Coxe, Sir James, death of, 500.
Cremation, 126, 240.
Crim, Dr. W. H., treatment of aneurism by Esmarch's bandage, 318.
Crura cerebri, disease of, 83.
Cystic adenoma of lower jaw, 228.
Cystitis, injection of quinine in, 440.
Cysto-phosphatic deposits, pathological history of, 270.

D.

DaCosta, Dr. J. M., cerebral tumor, syphilitic meningitis, 201; on phthisis, 330.
Davis, Dr. J. O., rectal alimentation, 159.
De Rossett, Dr. M. J., asthenopia from abnormal interocular distance, 225.
Dead fingers, 376.
Deformities, congenital, case of, 115.
Delafield, Dr. F., notice of Pathological Anatomy of, 375.
Dermoid cysts, 249.
Dessau, Dr. S. Henry, case of poisoning by carbolic acid, 289.
Detroit Lancet, notice of, 160.
Diabetes and lesions of the pancreas, 150; a new test for, 227; structural changes in sympathetic nerve in, 408.
Dialyzed iron, hypodermic injection of, 480.
Diarrhœa, summer, treatment of, 413, 485.
Digiti mortui, 376.
Diphtheria, 505; and defective drainage, 279; diagnosis of, 298; etiology of, 31, 495; treatment of, 21, 50, 61, 62, 98, 136, 157, 293, 377, 379, 396.
Disease germs, their origin and nature, 496.
Dorran, Dr. Wm. M., fracture of femur in children, 96.
Doses, large against small, 419.
Dover's powder, a new formula for, 178.
Drown, the easiest way to, 417.
Druggist, criminal negligence on part of, 359.
Duboisia myoporoides, 332.
Dyalized iron, hypodermic injection of, 290.
Dyspepsia, treatment of, 70, 443.

E.

Ear, acute catarrh of middle, 146; polypus in for forty years, 145.
Edel, Dr. C., treatment of diphtheria, 50.
Education, intervention of physicians in, 507.
Elastic bandage in varicose veins, 189.
Elbow, conservative surgery of, 134.
Electricity in the operating-room, 199.
Ely, Dr. Edward T., clinical otology, 144.
Endocarditis and typhoid fever, 188; chronic, 354.
Eneurisis in children, 500.
Ephemeral fever, 302.
Epididymitis, treatment of, 9, 206.
Epilepsy, curability of, 143; loss of consciousness in, 161; treatment of, 110, 162, 177, 264, 278, 300, 451.
Ergot, hypodermic injections of, 519; use of, after labor, 196.

Erichsen, John Eric, notice of Surgery of, 154.
Esmarch's bandage, new appliances for, 138.
Ether, death from, 19.
Ethics, remarks on, 76, 99.
Expert testimony, editoral remarks on, 32, 452.
Extra-uterine pregnancy, normal accouchement during, 150.

F.

Facial paralysis, treatment of, 51, 226.
Fairfield, Francis Gerry, a new high-power lens, 60.
Fallopian pregnancy, with specimen, 334.
Farquharson, Dr. R., notice of work by, 36.
Female right to stays, 432; patients, our relations to our, 313.
Femoral vein, thrombosis of, 155.
Femur, division of tendo-Achillis in fracture of, 209; fracture of shaft of, in children, 1; fracture of, in children, 95; treatment of fracture of, 9, 17, 87, 181, 349.
Fibroid, post-uterine, case of, 47.
Field, Dr. H. M., bromide of potassium in puerperal convulsions, 428.
Flint, Dr. Austin, rectal alimentation, 56.
Flower and fruit mission, 392.
Focal diseases of spinal cord, 422.
Fœtus, brainless, 433.
Follicular pharyngitis, contagiousness of, 298.
Forceps, a new obstetrical, 224.
Foster, Dr. Frank P., hysteria, 117.
Fowler, Dr. E. P., liberalism in homœopathy, 179.
France, population of, 20.
Fractures, American treatment of, 241; oblong bones, shortening in, 464, 472.
French, Dr. Geo. F., rectal speculum, 437.
Friendly professional visits, 358.
Fuller, Dr. Robert M., dose dispensing simplified, 184.
Furuncles, treatment of, 417.

G.

Galvano-caustic écraseur, 515.
Gangrene, spontaneous, and amputation, 15.
Gardner, Dr. R. W., hypophosphite of zinc, 356.
Gelsemium, poisoning by small doses of, 111.
Genital irritation and reflex phenomena, 274.
German universities, cost of, 20.
Gibney, Dr. V. P., talipes calcaneus, 235; ultimate results of excision of hip-joint, 174, 219, 276.
Glass, infrangible, danger of explosion of, 360.
Glosso-labial laryngeal paralysis, 598.
Glottis, spasm, without recognized cause, 232.
Glycerine in piles, 409.
Glycosuria and diabetes, 348.
Glycosuric reagent, a new, 227.
Goitre, etiology of, 70; treatment by interstitial injections, 150; treatment of, 505.
Gonorrhœa complicated with endocarditis, 188; nature of, 381; treatment of, 188, 441.
Gonorrhœal epididymitis, 249.
Goodell, Dr. W., caruncle of female urethra, 246; cystitis in female, 66.
Gouty habit and nervous diseases, 111.
Gouley, Dr. J. W. S., stricture of urethra, 475.
Griffiths, Dr. Handsel, death of, 99.
Gross, Dr. S. W., stricture of urethra, 461.
Gynæcological statistics, 133.

H.

Hæmorrhoids, injection of carbolic acid in, 168, 409.
Hæmatoxylin, use of, 97.
Hall, Dr. W. E., death of, 516.
Hamilton, Dr. Allan McLane, auditory epilepsy, 107.
Hamilton, Dr. F. H., American apparatus, 359; fracture of humerus, 85; fracture of shaft of femur in children, 1; treatment of fracture of femur, 181; notice of work by, 153.
Hammond, case of Ex-Surgeon General, 191.
Hanks, Dr. H. T., atomizers for spraying the throat, 260; laceration of cervix uteri, 195.
Hand, best treatment for mutilation of, 420.
Harrison, Mr. Reginald, complimentary dinner to, 300.
Harris, Dr. P. A., intestinal obstruction, 149.
